IN THIS PAPER, PREPARED FOR THE APRIL 1967 TEXAS SYMPOSIUM ON LINGUISTIC UNIVERSALS, IT IS PROPOSED THAT THE GRAMMATICAL NOTION "CASE" DESERVES A PLACE IN THE BASE COMPONENT OF THE GRAMMAR OF EVERY LANGUAGE. IT IS ARGUED THAT PAST RESEARCH HAS NOT LED TO VALID INSIGHTS ON CASE RELATIONSHIPS AND THAT WHAT IS NEEDED IS A CONCEPTION OF BASE STRUCTURE IN WHICH CASE RELATIONSHIPS ARE PRIMITIVE TERMS OF THE THEORY AND IN WHICH SUCH CONCEPTS AS "SUBJECT" AND "DIRECT OBJECT" ARE MISSING, THE LATTER ARE REGARDED AS PROPER ONLY TO THE SURFACE STRUCTURE OF SOME (BUT POSSIBLY NOT ALL) LANGUAGES. BASIC TO THESE ARGUMENTS ARE TWO ASSUMPTIONS NOW TAKEN FOR GRANTED BY GENERATIVE GRAMMARIANS—(1) THE CENTRALITY OF SYNTAX, AND (2) THE IMPORTANCE OF COVERT CATEGORIES. THE AUTHOR PROPOSES "THAT THERE ARE MANY SEMANTICALLY RELEVANT SYNTACTIC RELATIONSHIPS INVOLVING NOUNS AND THE STRUCTURES THAT CONTAIN THEM, THAT THESE RELATIONSHIPS ARE IN LARGE PART COVERT BUT ARE NEVERTHELESS EMPIRICALLY DISCOVERABLE, THAT THEY FORM A SPECIFIC FINITE SET, AND THAT OBSERVATIONS MADE ABOUT THEM WILL TURN OUT TO HAVE CONSIDERABLE CROSS-LINGUISTIC VALIDITY." HE REFERS TO THESE AS "CASE" RELATIONSHIPS AND THE GRAMMAR PROPOSED AND OUTLINED HERE IS "CASE GRAMMAR." THE SUBSTANTIVE MODIFICATION TO THE THEORY OF TRANSFORMATIONAL GRAMMAR WHICH HE PROPOSES AMOUNTS TO A REINTRODUCTION OF THE "CONCEPTUAL FRAMEWORK" INTERPRETATION OF CASE SYSTEMS BUT WITH A CLEARER UNDERSTANDING OF THE DIFFERENCE BETWEEN DEEP AND SURFACE STRUCTURE. THE SENTENCE IN ITS BASIC STRUCTURE CONSISTS OF A VERB AND ONE OR MORE NOUN PHRASES, EACH ASSOCIATED WITH THE VERB IN A PARTICULAR CASE RELATIONSHIP. THE "EXPLANATORY" USE OF THIS FRAMEWORK RESIDES IN THE NECESSARY CLAIM THAT, ALTHOUGH THERE CAN BE COMPOUND INSTANCES OF A SINGLE CASE (THROUGH NOUN PHRASE CONJUNCTION), EACH CASE RELATIONSHIP OCCURS ONLY ONCE IN A SIMPLE SENTENCE. THIS DOCUMENT WILL APPEAR IN "PROCEEDINGS OF THE TEXAS SYMPOSIUM ON LANGUAGE UNIVERSALS, APRIL 13-15, 1967," EMON BACH AND ROBERT HARMS, EDITORS, HOLT, RINEHART AND WINSTON. (JG)
The Case for Case*

by

Charles J. Fillmore
The Ohio State University

*The time I needed for preparing this study was created by an act of the College of Arts and Sciences of The Ohio State University: I was released from teaching duties during the winter quarter of 1967. I gratefully acknowledge this boost and hope that I may be forgiven for changing topics mid-quarter. Many co-workers have kept me supplied with suggestions, criticisms and challenges during the past few months. I am particularly indebted to D. Terence Langendoen (Ohio State), George Lakoff (Harvard) and Paul M. Postal (Queens College). I shall probably soon regret that I have not always been wise enough to follow their counsel.
The Case for Case

Charles J. Fillmore
The Ohio State University

Prepared for the 1967 Texas Symposium on Linguistic Universals,
April 13-15.

Speculation on language universals has not always and
everywhere been viewed as a fully respectable pastime for the
scientific linguist. The writer recalls a Linguistic Institute
lecture of not many summers ago in which it was announced that
the only really secure generalization on language that linguists
are prepared to make is that "some members of some human communi-
ties have been observed to interact by means of vocal noises."
Times have changed, it is a pleasure to report, and this is partly
because we now have clearer ideas about what linguistic theories
are theories of, and partly because some linguists are willing to
risk the danger of being dead wrong.

Scholars who have striven to uncover syntactic features common
to all of the world's languages have generally addressed themselves
to three intimately related but distinguishable orders of questions,
and they are: (a) what are the formal and substantive universals
of syntactic structure? (b) is there a universal base, and, if so,
what are its properties? and (c) are there any universally valid
constraints on the ways in which deep structure representations of
sentences are given expression in the surface structure?

Concerning formal universals we find such proposals as Chomsky's,
that each grammar has a base component capable of characterizing
the underlying syntactic structure of just the sentences in the
language at hand and which contains at least a set of transformation rules the function of which is to map the underlying structures provided by the base component into structures more closely identifiable with phonetic descriptions of utterances in that language.\(^1\) A representative statement on substantive

syntactic universals is Lyons' assertion that every grammar requires such categories as Noun, Predicator and Sentence, but that other grammatical categories and features may be differently arranged in different languages.\(^2\) And Bach has given reasons to

\(^2\)John Lyons, "Towards a 'notional' theory of the 'parts of speech'," JOURNAL OF LINGUISTICS, II(1966) 209-238; 211, 223.

believe that there is a universal set of transformations which each language draws from in its own way, and he has shown what such transformations might look like in the case of relative clause modification.\(^3\)

\(^3\)Emmon Bach, "On some recurrent types of transformations," GEORGETOWN UNIVERSITY MONOGRAPH NO. 18 ON LANGUAGES AND LINGUISTICS (1965) 3-18.

Discussions on the possibility of a universal base (as distinct from claims about universal constraints on the form of the base component) have mainly been concerned with whether the elements specified in the rules of a universal base—if there is one—are sequential or not. A common assumption is that the universal
base specifies the needed syntactic relations, but the assign-
ment of sequential order to the constituents of base structures
is language specific. Appeals for sequence-free representations
of the universal deep structure have been made by Halliday. 4

4M. A. K. Halliday, "Some notes on 'deep' grammar," JOURNAL OF

Tesniere 5, and others. Lyons 6 recommends leaving for empirical

5Lucian Tesniere, ELEMENTS DE SYNTAXE STRUCTURALE, Paris-Klincksieck
(1959).

investigation the question of the relationship between the under-
lying representation and sequential order, and Bach 7 has suggested

7Bach (1965) 13.

that continued investigation of the syntactic rules of the world's
languages may eventually provide reasons for assuming specific
ordering relations in the rules of a universal base.

Greenberg's statistical studies of sequence patterns in
selected groups of languages do not, it seems to me, shed any
direct light on the issue at hand. 8 They may be regarded as pro-

8Joseph Greenberg, "Some universals of grammar," in J. Greenberg,

viding data which, when accompanied by an understanding of the
nature of syntactic processes in the specific languages, may even-
tually lend comfort to some proposal or other on either the sequential properties of the base component or the universal constraints which govern the surface ordering of syntactically organized objects.

Findings which may be interpreted as suggesting answers to our third question are found in the 'markedness' studies of Greenberg\(^9\) and in the so-called 'implicational universals' of

---

---

Jakobson.\(^10\) If such studies can be interpreted as making empirical assertions about the mapping of deep structures into surface structures, they may point to universal constraints of the following form: While the grammatical feature 'dual' is made use of in one way or another in all languages, only those languages which have some overt morpheme indicating 'plural' will have overt morphemes indicating 'dual'. The theory of implicational universals does not need to be interpreted, in other words, as a set of assertions on the character of possible deep structures in human languages and the ways in which they differ from one another.

The present essay is intended as a contribution to the study of formal and substantive syntactic universals. Questions of linear ordering are left untouched, or at least unresolved, and
questions of markedness are viewed as presupposing structures having properties of the kind to be developed in these pages.

My paper will plead that the grammatical notion 'case' deserves a place in the base component of the grammar of every language. In the past, research on 'case' has amounted to an examination of the variety of semantic relationships which can hold between nouns and other portions of sentences; it has been considered equivalent to the study of semantic functions of inflectional affixes on nouns or the formal dependency relations which hold between specific nominal affixes and lexical-grammatical properties of neighboring elements; or it has been reduced to a statement of the morphophonemic reflexes of a set of underlying 'syntactic relations' which themselves are conceived independently of the notion of 'case'. I shall argue that valid insights on case relationships are missed in all these studies, and that what is needed is a conception of base structure in which case relationships are primitive terms of the theory\(^{11}\) and in which such concepts as 'subject' and 'direct object' are missing. The latter are regarded as proper only to the surface structure of some (but possibly not all) languages.

\(^{11}\)Notational difficulties make it impossible to introduce 'case' as a true primitive as long as the phrase-structure model determines the form of the base rules. My claim is, then, that a designated set of case categories is provided for every language, with more or less specific syntactic, lexical and semantic consequences, and that the attempt to restrict the notion of 'case' to the surface structure must fail.
Two assumptions are essential to the development of the argument, assumptions that are, in fact, taken for granted by workers in the generative grammar tradition. The first of these is the centrality of syntax. There was a time when a typical linguistic grammar was a long and detailed account of the morphological structure of various classes of words, followed by a two or three-page appendix called 'Syntax' which offered a handful of rules of thumb on how to 'use' the words described in the preceding sections—how to combine them into sentences.

In grammars where syntax is central, the forms of words are specified with respect to syntactic concepts, not the other way around. The modern grammarian, in other words, will describe the 'comparative construction' of a given language in the most global terms possible, and will then add to that a description of the morphophonemic consequences of choosing particular adjectives or quantifiers within this construction. This is altogether different from first describing the morphology of words like taller and more and then adding random observations on how these words show up in larger constructions.¹²

¹²John R. Ross pointed out, during the symposium, that there exist some syntactic processes which seem to depend on (and therefore 'follow') particular lexical realizations of just such entities as the comparative forms of adjectives. Compared adjectives, in short, may be iterated, just as long as they have all been given identical surface realizations. Witness

(i) she became friendlier and friendlier
(ii) she became more and more friendly
but not
(iii) *she became friendlier and more friendly
The second assumption I wish to make explicit is the importance of covert categories. Many recent and not-so-recent studies have convinced us of the relevance of grammatical properties which lack obvious 'morphemic' realizations but whose reality can be observed on the basis of selectional constraints and transformational possibilities. We are constantly finding that grammatical features found in one language show up in some form or other in other languages as well, if we have the subtlety it takes to discover covert categories. Incidentally, I find it interesting that the concept 'covert category'—a concept which is making it possible to believe that at bottom all languages are essentially alike—was introduced most convincingly in the writings of Whorf, the man whose name is most directly associated with the doctrine that deep-seated structural differences between languages determine the essentially non-comparable ways in which speakers of different languages deal with reality.\footnote{Benjamin Lee Whorf, "A linguistic consideration of thinking in primitive communities" (c. 1936), in J. B. Carroll, ed., LANGUAGE, THOUGHT AND REALITY: SELECTED WRITINGS OF BENJAMIN LEE WHORF, MIT Press (1965) 65-86; 69ff.}

One example of a 'covert' grammatical distinction is the one to which traditional grammarians have attached the labels 'affectum' vs. 'effectum', in German 'affiziertes Objekt' vs. 'effiziertes Objekt.' The distinction, which is reportedly made overt in some languages, can be seen in sentences (1) and (2) below.

(1) John ruined the table

(2) John built the table
Note that in one case the object is understood as existing antecedently to John's activities, while in the other case its existence resulted from John's activities.

Having depended so far on only 'introspective evidence', we might be inclined to say that the distinction is purely a semantic one, one which the grammar of English does not force us to deal with. Our ability to give distinct interpretations to the verb-object relation in these two sentences has no connection, we might feel, with a correct description of the specifically syntactical skills of a speaker of English.

The distinction does have syntactic relevance, however. The 'effectum' object, for example, does not permit interrogation of the verb with do to, while the affectum object does. Thus one might relate sentence (1), but not sentence (2), to the question given in (3).

(3) what did John do to the table?

Furthermore, while sentence (1) has sentence (4) as a paraphrase, sentence (5) is not a paraphrase of sentence (2).

(4) what John did to the table was ruin it
(5) *what John did to the table was build it'

This observation is due to Paul M. Postal.

To give another example, note that both of the relationships in question may be seen in sentence (6) but that only in one of the two senses is sentence (6) a paraphrase of sentence (7).

(6) John paints nudes
(7) what John does to nudes is paint them
There is polysemy in the direct object of (6), true, but the difference also lies in whether the objects John painted existed before or after he did the painting.

I am going to suggest below that there are many semantically relevant syntactic relationships involving nouns and the structures that contain them, that these relationships—like those seen in (1) and (2)—are in large part covert but are nevertheless empirically discoverable, that they form a specific finite set, and that observations made about them will turn out to have considerable cross-linguistic validity. I shall refer to these as 'case' relationships.
1. Earlier approaches to the study of case

Books written to introduce students to our discipline seldom fail to acquaint their readers with the 'wrong' ways of using particular case systems as universal models for language structure. Grammarians who accepted the case system of Latin or Greek as a valid framework for the linguistic expression of all human experience were very likely, we have been told, to spend a long time asking the wrong kinds of questions when they attempted to learn and describe Aleut or Thai. We have probably all enjoyed sneering, with Jespersen, at his favorite 'bad guy', Sonnenschein, who, unable to decide between Latin and Old English, allowed modern English teach to be described as either taking a Dative and an Accusative, because that was the pattern for Old English teach, or as taking two Accusatives, in the manner of Latin doceo and German lehren.  

Looking for one man's case system in another man's language is not, of course, a good example of the study of case. The approaches to the study of case that do need to be taken seriously are of several varieties. Many traditional studies have examined, in somewhat semantic terms, the various uses of case. More recent work has been directed toward the analysis of the case systems of given languages, under the assumptions suggested by the word 'system.' A great deal of research, early and late, has been devoted to an
understanding of the **history** or **evolution** of case notions or of case morphemes. And lastly, the generative grammarians have for the most part viewed case markers as surface structure reflexes, introduced by rules, of various kinds of deep and surface syntactic relations.

1.1 Case uses

The standard handbooks of Greek and Latin typically devote much of their bulk to the classification and illustration of semantically different relationships representable by given case forms. The sub-headings of these classifications are most commonly of the form 'X of Y', where 'X' is the name of a particular case and 'Y' is the name for a particular 'use' of X. The reader will recall such terms as 'Dative of Separation', 'Dative of possession', and so on.  

---

16. For an extensive description of this type, see Charles Bennett, **SYNTAX OF EARLY LATIN, II: THE CASES**, Boston (1914) Pp. 409.

Apart from the fact that such studies do not start out from the point of view of the centrality of syntax, the major defects of these studies were (a) that the Nominative was largely ignored and (b) that classificatory criteria were often confused which ought to have been kept distinct.

The neglect of the nominative in studies of case uses probably has several sources, one being the etymological meaning ('deviation') of the Greek term for case, *ptôsis*, which predisposed grammarians to limit the term only to the non-nominative cases. The most important reason for omitting the nominative in these studies, however,
is the wrongly assumed clarity of the concept 'subject of the sentence.' Müller published a study of nominative and accusative case uses in Latin, in 1908, in which he devoted 170 some pages to the accusative, somewhat less than one page to the nominative, explaining that "Die beiden casus recti, der Nominativ und der Vokativ, sind bei dem Streite über die Kasustheorie nicht beteiligt. Im Nominativ steht das Subjekt, von dem der Satz etwas aussagt." 17

The role of the subject was regarded as so clear to Sweet that he went so far as to claim that the nominative is the only case where one can speak properly of a 'noun'. A sentence is viewed as a kind of predication on a given noun, and every noun-like element in a sentence other than the subject is really a kind of derived adverb, a part of the predication. 18

18 Quoted in Jespersen (1924) 107.

On a little reflection, however, it becomes obvious that semantic differences in the relationships between subjects and verbs are of exactly the same order and exhibit the same extent of variety as can be found in the other cases. There is in principle no reason why the traditional studies of case uses fail to contain such classifications as 'Nominative of Personal Agent', 'Nominative of Patient', 'Nominative of Beneficiary', 'Nominative of Affected Person', and 'Nominative of Interested Person' (or, possibly, 'Ethical Nominative') for such sentences as (8) to (12) respectively.
(8) he hit the ball
(9) he received a blow
(10) he received a gift
(11) he loves her
(12) he has black hair

The confusion of criteria in treatments of the uses of cases has been documented by de Groot in his study of the Latin genitive.19

Uses of cases are classified on syntactic grounds, as illustrated by the division of uses of the genitive according to whether the genitive noun is in construction with a noun, an adjective or a verb; on historical grounds, as when the uses of the syncretistic Latin ablative case are divided into three classes, separative, locative and instrumental; and on semantic grounds, in which there is a great deal of confusion between meanings that can properly be thought of as associated with the case forms of nouns, on the one hand, and meanings that properly reside in neighboring words.

De Groot's critical treatment of the traditional classification of Latin genitive case uses is particularly interesting from the point of view taken here, because in his 'simplification' of the picture he rejects as irrelevant certain phenomena which generative grammarians would insist definitely are of syntactic importance. He claims, for example, that the traditional studies confuse difference of referents with differences of case uses. Thus, to de Groot the traditional three senses of statua Myronis (the statue possessed
by Myro--genitivus possessivus; statue sculpted by Myro--
genitivus subjectivus; statue depicting Myro--genitive of
representated subject) as well as the subjective and objective
senses of amor patris, are differences in practical, not in
linguistic facts. From arguments such as this he is able to combine
twelve of the classical 'uses' into one, which he then labels the
'proper genitive', asserting that "the proper genitive denotes, and
consequently can be used to refer to, any thing-to-thing relation."\textsuperscript{20}

\textsuperscript{20}de Groot (1956) 35.

He ends by reducing the thirty traditional 'uses of the genitive'
to eight\textsuperscript{21}, of which two are rare enough to be left out of consider-

\textsuperscript{21}From de Groot (1956) 30:
1. Adjunct to a noun
   A. Proper genitive, eloquentia hominis
   B. Genitive of quality, homo magnum eloquentiae
2. Adjunct to a substantival
   C. Genitive of the set of persons, reliqui peditum
3. Conjunct ('complement') of a copula
   D. Genitive of the type of person, sapientis est aperte
      odisse
4. Adjunct to a verb
   E. Genitive of purpose, Aegyptum profiscitue cognoscende
      antiquitatis
   F. Genitive of locality, Romae consules creabantur
5. Adjunct to a present participle
   G. Genitive with a present participle, laboris fugiens
6. Genitive of exclamation, mercimoni lepidi

ation, and a third, 'genitive of locality', is really limited to
specific place names.

Benveniste's reply to de Groot's analysis appeared in the issue
of LINGUA dedicated to de Groot\textsuperscript{22}. There he proposes still further

\textsuperscript{22}Emile Benveniste. "Pour l'analyse des fonctions casuelles: le
simplifications of the classification. Noting that de Groot's 'genitive of locality' applies only to proper place names, that is, that it occurs only with place-names having -o- and -a- stems, in complementary distribution with the ablative, Benveniste wisely suggests that this is something that should be catalogued as a fact about place names, not as a fact about uses of the genitive case. Benveniste's conclusions on the remaining genitive constructions is quite congenial to the generative grammarian's position. He proposes that the so-called 'proper genitive' basically results from the process of converting a sentence into a nominal. The meaning distinction between 'genitivus subjectivus' and 'genitivus objectivus' constructions merely reflects the difference between situations in which the genitive noun is an original subject or and those where it is an original object, the genitive representing a kind of neutralization of the nominative/accusative distinction found in the underlying sentences.\footnote{It must be said, however, that Benveniste's desentential interpretation is diachronic rather than synchronic, for he goes on to explain that it is on analogy from these basic verbal sources that new genitive relations are created. From ludus pueri and risus pueri, where the relation to ludit and ridet is fairly transparent, the pattern was extended to include somnus pueri, mos pueri, and finally liber pueri. The genitive grammarian may be inclined to seek synchronic verbal connections--possibly through positing abstract entities never realized as verbs--for these other genitives too. (See Benveniste (1962) 17.)}

At least from the two mentioned studies of uses of the Latin genitive, it would appear (a) that some case-uses are purely irregular, requiring as their explanation a statement of the idiosyncratic grammatical requirements of specific lexical items, and
(b) that some semantic differences are accounted for independently of assigning 'meanings' to cases: either by recognizing meaning differences in 'governing' words, or by noting meaning differences in different underlying sentences. The suggestion that one can find clear special meanings associated with surface cases fails to receive strong support from these studies.

1.2 Case systems

There are reasonable objections to approaching the case system of one language from the point of view of the surface case system of another (say, Classical Latin) by merely checking off the ways in which a given case-relation in the chosen standard is given expression in the language under observation. An acceptable alternative, apparently, is the inverse of this process: one identifies case morphemes in the new language within the system of noun inflection, and then relates each of these to traditional or 'standard' case notions. To take just one recent example, Redden finds five case indices in Walapai (four suffixes and zero) and identifies each of these with terms taken from the tradition of case studies: -c is nominative, -Ø is accusative, -k is allative/ adessive, -l is illative/inessive, and -m is ablative/abessive. Under each of these headings the author adds information about the uses of the case-forms that may not be deducible from the labels themselves. Nominative, for example, occurs only once in

a simple sentence--coordinate conjunction of subject nouns
requires use of the -m suffix on all the extra nouns introduced;
accusative is used with some noun tokens which would not be
considered direct objects in English; allative/adessive has a
partitive function; and ablative/abessive combines ablative,
instrumental, and comitative functions.

In a study of this type, since what is at hand is the surface
structure of the inflection system of Walapai nouns, the descric-
tive task is to identify the surface case forms that are distinct
from each other in the language and to associate 'case functions'
with each of these. What needs to be emphasized is (a) that such
a study does not present directly available answers to such questions
as "how is the indirect object expressed in this language?" (i.e.,
the system of possible case functions is not called on to provide
a descriptive framework), and (b) that the functions or uses them-
selves are not taken as primary terms in the description (i.e., the
various 'functions' of the 'ablative/abessive' suffix -m are not
interpreted as giving evidence that several distinct cases merely
happen to be homophonous).^{25}

^{25} These remarks are not intended to be critical of Redden's study.
Indeed, in the absence of a universal theory of case relationships
there is no theoretically justified alternative to this approach.

One approach to the study of case systems, then, is to restrict
oneself to a morphological description of nouns and to impose no
constraints on the ways in which the case morphemes can be identi-
fied with their meanings or functions. This is distinct from studies
of case systems which attempt to find a unified meaning for each
of the cases discovered in the language being studied. An example of the latter approach is found in the now discredited 'localistic' view of the cases in Indo-European, by which dative is 'the case of rest,' accusative 'the case of movement to,' and genitive 'the case of movement from.'

This interpretation, discussed briefly in Jespersen (1924) p. 186, appears to date back to the Byzantine grammarian Maxime Planude. Attempts to capture single comprehensive 'meanings' of the cases have suffered from the vagueness and circularity expected of any attempt to find semantic characterizations of surface-structure phenomena.

As an illustration of this last point, take Gonda's claim that the Vedic dative is called for whenever a noun is used to refer to the 'object in view.' The vacuity of this statement is seen in his interpretation of

(i) vātāya kapila vidyut (Patanjali)
'a reddish lightning signifies wind'
as "the lightning has, so to say, wind in view". J. Gonda, "The unity of the Vedic dative," LINGUA, XI (1962) 141-150; 147.

The well-known studies of Hjelmslev and Jakobson are

Louis Hjelmslev, "La catégorie des cas," ACTA JUTLANDICA, Aarhus, VII.1 (1935) i-xii, 1-184; and IX.2 (1937) i-vii, 1-78.

Attempts not only to uncover unified meanings of each of the cases, but also to show that these meanings themselves form a coherent
system by their decomposability into distinctive oppositions. The possibility of vagueness is of course the more increased inasmuch as the number of oppositions is less than the number of cases.  

The difficulties in discovering a unified meaning for each of the cases in a case system has led to alternative view: that all but one of the cases can be given more or less specific meanings, the meaning of the residual case being left open. This residual case can either have whatever relation to the rest of the sentence is required by the meanings of the neighboring words, or it can serve any purely case-like function not pre-empted by the other cases. Goedicke is said by Bennett to have explained the accusative as "the case used for those functions not fulfilled by the other cases." The fact that Bennett, following Whitney, ridiculed this view on the grounds that any case could be so described, suggests that Goedicke's remark could not have been very clearly expressed. 31 A different approach is taken by Diver, 32 who does

31 Bennett (1914) 195, fn. 1. At the time of writing I have not yet had access to the Goedicke original.

not assign the 'left-over' function to a particular case as such, but to whatever case or cases are not required for a given realiz-
tion of what he calls the 'agency system'. Briefly, and ignoring his treatment of passive sentences, Diver's analysis is this: A verb can have one, two, or three nouns (or noun phrases) associated with it, corresponding generally to the intransitive, normal transitive, and transitive indirect object sentence types respectively. In a three-noun sentence, the nouns are nominative, dative and accusative, the nominative being the case of the Agent, the accusative the case of the Patient, with the dative, as the 'residue' case, capable of expressing any notion compatible with the meaning of the remainder of the sentence. The function of the dative in a three-noun sentence, in other words, is 'deduced' from the context, not present as one of a number of possible 'meanings' of the dative case.33

33The following is from Diver (1964) 181: "In the sentence senatus imperium mihi dedit 'the senate gave me supreme power', the Nominative, with the syntactic meaning of Agent, indicates the giver; the Accusative, with the syntactic meaning of Patient, indicates the gift. The question is: Does the Dative itself indicate the recipient or merely that the attached word is neither the giver nor the gift?" Diver makes the latter choice. In particular, he states that "knowing that mihi, in the Dative, can be neither the Agent (the giver) nor the Patient (the gift), we deduce that it is the recipient."

In two-noun sentences, one of the nouns is nominative, the other either dative or accusative, but typically accusative. The nominative here is the case of the agent, but this time the accusative (or the dative, whichever occurs) is the residue case. In a two-noun sentence, in other words, the accusative is not limited to the meaning of Patient but can express any number of other meanings as well. And, since it no longer contrasts with dative, it can be replaced by a dative. The choice between dative and accusative in
two-noun sentences, since it is not semantically relevant, is subject to random kinds of free and conditioned variation.

Carrying the argument through, the noun found in a one-noun sentence can express any meaning relationship with the verb. The noun, though most frequently nominative, may be accusative or dative, but the choice is not due to meanings associated with these cases. When the noun is nominative its 'syntactic meaning' may be that of Agent, Patient, or anything else.

The inadequacy of Diver's treatment is clear. In the first place, it seems unlikely that, as used in Diver's paper, the notions Agent and Patient are in any sense satisfactory semantic primitives. To agree that imperium in senatus imperium mihi dedit is the Patient is nothing more than to agree to say the word 'Patient' on seeing an accusative form in a three-noun sentence. For many of Diver's examples, his argument would have been every bit as convincing if he had said that there is an unvarying function performed by the dative, but the role of the accusative depends on such matters as the lexical meaning of the verb. Furthermore, the "couple of dozen verbs" which appear in two-noun sentences and which exhibit some kind of semantic correlation involving the supposedly non-significant choice of accusative or dative should probably not be set aside as unimportant exceptions.

Diver's proposal may be thought of as an attempt to identify the semantic contribution of cases seen as syntagmatically identified entities, while the positing of distinctive oppositions, in the manner of Hjelmslev and Jakobson, is an attempt to see the functioning of cases from the point of view of the concept of
paradigmatic contrast. The latter view has been criticized by Kuryłowicz. The apparent contrast seen in Polish and Russian

between accusative and genitive (partitive) direct object, as between (13) and (14)

(13) daj nam chleb 'give us the bread'
(14) daj nam chleba 'give us some bread'

is not a difference in the syntactic function of the object nouns relative to the verb, but is rather a difference which falls into that area of syntax that deals with the effect of the choice of article, in languages having articles, on the semantic content of the associated noun. The fact that in Russian the difference is reflected as a difference in noun inflection does not alone determine its character as a part of the case system proper of the language.

The vertical contrast between locative and accusative nouns after locative/directional prepositions, as in (15) and (16)

(15) on prygajet na stole 'he jumps (up and down) on the table'
(16) on prygajet na stol 'he jumps onto the table'

is a difference that would be discussed in transformational-grammar terms as involving a distinction between preposition-phrases which are inside and those which are outside the verb phrase constituent. That is, a Locative preposition-phrase which occurs outside the
constituent VP is one which indicates the place where the action described by the VP takes place. A Locative preposition-phrase inside the VP is a complement to the verb. Inside a VP the difference between the locative and directional senses is entirely dependent on the associated verb; outside the VP the sense is always locative.

Kurylowicz discussed (15) and (16) in essentially the same terms. To him the directional phrase na stol is 'more central' to the verb than the locative phrase na stole. An apparent contrast appears just in case the same verb may appear sometimes with and sometimes without a locative (or directional) complement. There is thus no genuine paradigmatic contrast found in such pairs as (13)-(14) or (15)-(16).

Kurylowicz's own approach to the study of case systems brings another order of grammatical fact into consideration: sentence relatedness. Cases, in his view, form a network of relationships mediated by such grammatical processes as the passive transformation. The distinction between nominative and accusative, for example, is a reflection in the system of cases of the more basic distinction between passive and active sentences. In his terms, hostis occiditur becomes the predicate hostem occidit, the primary change from occiditur to occidit bringing with it the concomitant change from hostis to hostem.

Nominalizations of sentences have the effect of relating both accusative and nominative to the genitive, for the former two are neutralized under conversion to genitive, as illustrated by the change from plebs secedit to secessio plebis (genitivus subjectivus)
as opposed to the change from hostem occidere to occisio hostis (genitivus objectivus).

The relationship between nominative and accusative, then, is a reflex of diathesis; the relationship of these two to genitive is mediated through the process of constructing deverbal nouns. The remaining cases—dative, ablative, instrumental and locative—enter the network of relationships in that, secondarily to their functions as adverbials, they each provide variants of the accusative with certain verbs. That is, there are verbs that 'govern' the ablative (e.g., utor), say, rather than the accusative for their 'direct objects'.

1.3 Case histories

In addition to studies of case uses and interpretations of the cases in a given language as elements of a coherent system, the literature also contains many historical studies of cases; and these, too, are of various kinds. Some workers have sought to discover the original meanings of the cases of a language or family of languages, while others have sought to trace case morphemes back to other kinds of morphemes—either syntactic function words or some kind of derivational morphemes. Still others have seen
in the history of one case system a case system of a different type—without or without assumptions concerning the ‘essential primitivity’ of the earlier type.

A very common assumption among linguistic historians has been that case affixes are traceable back to non-case notions. The form which eventually became the Indo-European case ending representing nominative singular masculine, i.e. 

\[ *-s \]

has been interpreted the demonstrative 

\[ *so \]

which had been converted into a suffix indicating a definite subject; and the 

\[ *so \]

in turn is believed by some to have originated as a Proto-Indo-Hittite sentence connective. 

---

---

The same form has also been interpreted as a derivational morpheme indicating a specific individual directly involved in an activity, contrasting with a different derivational affix 

\[ *m \]

indicating a non-active object or the product of an action. 

---

37 See, for example, the statement by Winfred P. Lehmann in his "On earlier stages of the Indo-European nominal inflection," LANGUAGE, XXXIV (1958) 179-202; 190.

---

rest with the latter view are those who do not require of themselves the belief that 'synthetic' languages necessarily have antecedent 'analytic' stages.

---

38 The impression is sometimes given that the identification of the etymon of a case affix brings with it an account of the intellectual evolution of the speakers of the language in question. If the
interpretation of *-m and *-s as derivational morphemes is correct, it does not follow that one has discovered, in the transition from the earliest function of these elements to their later clear case-like use of 'abstraction' process, or tendency to pass from 'concrete' to 'relational' modes of thought. Our methods of reconstruction should certainly make it possible to detect basic (i.e., deep structure) linguistic evolution if it is there to discover, but the etymology of surface-structure morphemes should not lead to assumptions about deep typological differences. What I mean is that the underlying case structures of Proto-Indo-European may have been just as precisely organized as those of any of the daughter languages, and that the changes that have occurred may have been entirely a matter of morphophonemic detail. From the preponderance of (derived) active nouns in subject position, one generation may have 're-interpreted' the suffix as a marker of human subject; a later generation may have re-interpreted it as merely a marker for the subject use of a particular set of words—to state the possibilities in the most simple-minded way. The change, in short, may well have been entirely in the economies of bringing to the surface underlying structural features which themselves underwent no change whatever.

A second kind of speculation on historical changes within case systems traces case systems of one kind back to case systems of another kind. Of particular interest here is the suggestion that the Indo-European case systems point back to an original 'ergative' system. Case typologies will be discussed in slightly greater detail below, but briefly we can characterize an 'ergative' system as one which assigns one case (the Ergative) to the subject of a transitive verb, another to both the subject of an intransitive verb and the object of a transitive verb. An 'accusative' system, on the other hand, is one which assigns one case to the subject of either transitive or intransitive verbs, another (the Accusative) to the object of a transitive verb. A common feature of ergative systems is that the 'genitive' form is the same as the Ergative (or, put differently, that the Ergative case has a 'genitive' function).
The connection of Indo-European *-s with animateness (the subject of a transitive verb is typically animate), the original identity of the nominative singular *-s with the genitive ending, and the identity of the neuter ending *-m with the masculine accusative form, have led many investigators to the conclusion that our linguistic ancestors were speakers of an 'ergative' language.\(^{39}\) It will be suggested below that, if such a change has taken place, it is a change which involves the notion 'subject'.

\(^{39}\) See particularly C. C. Uhlenbeck, "Agens und Patiens im Kasussystem der indogermaischen Sprachen," INDOGERMANISCHE FORSCHUNGEN, XII (1901), 170-171, where the *-m ending was identified as a subject marker, the *-s as the agent marker in passive sentences (a common interpretation of 'ergative' systems); and André Vaillant, "L'ergatif indo-européen," BULLETIN DE LA SOCIÉTE LINGUISTIQUE DE PARIS, XXVII (1936) 93-108. Lehmann finds the arguments unconvincing, noting for example that evidence of an 'ergative' ending cannot be found in plural nouns or in feminines in s. (Lehmann (1958) 190.)

1.4 Case in current generative grammar

A hitherto largely unquestioned assumption about case in the writings of generative grammarians has been made explicit by Lyons: "'case' (in the languages in which the category is to be found) is not present in 'deep structure' at all, but is merely the inflectional 'realization' of particular syntactic relationships."\(^{40}\)

\(^{40}\) Lyons (1966) 218.

The syntactic relationships in question may in fact be relationships that are defined only in the surface structure, as when the surface subject of a sentence (destined to assume, say, a
'nominative' form) has appeared as the result of the application of the passive transformation, or when the 'genitive' marker is introduced as an accompaniment to a nominalization transformation. One of Chomsky's few remarks on case is in a discussion of the peripheral nature of stylistic inversions; although case forms are assigned to English pronouns relatively late in the grammar, determined largely on surface structure position, the stylistic inversion rules are later still. In this way it becomes possible to account for such forms as him I like, etc.; the shift of him to the front of the sentence must follow the assignment of case forms to the pronouns.\footnote{Chomsky (1965) 221f.}

\footnote{The suggestion is of course not novel. According to Hjelmslev, the first scholar to show a connection between prepositions and cases was A.-F. Bernhardi, in ANFANGSGRUNDE DER SPRACHWISSENSCHAFT, Berlin (1805); see Hjelmslev (1934) 24. I have not yet seen the Bernhardi work.}

It seems to me that the discussion of case could be seen in a somewhat better perspective if the assignment of case forms were viewed as exactly analogous to the rules for assigning prepositions in English, or postpositions in Japanese.\footnote{The suggestion is of course not novel. According to Hjelmslev, the first scholar to show a connection between prepositions and cases was A.-F. Bernhardi, in ANFANGSGRUNDE DER SPRACHWISSENSCHAFT, Berlin (1805); see Hjelmslev (1934) 24. I have not yet seen the Bernhardi work.} There are languages which use case forms quite extensively, and the assumption that the case forms of nouns can be assigned in straightforward ways on the basis of simply defined syntactic relations seems to be based too much on the situation with English pronouns.

Prepositions in English—or the absence of a preposition before a noun phrase, which may be treated as corresponding to a
zero or unmarked case affix—are selected on the basis of several types of structural features, and in ways that are exactly analogous to those which determine particular case forms in a language like Latin: identity as (surface) subject or object, occurrence after particular verbs, occurrence in construction with particular nouns, occurrence in particular constructions, and so on. The only difficulties in thinking of these two processes as analogous are that even the most elaborate case languages may also have combinations of, say, prepositions with case forms, and that some prepositions have independent semantic content. The first of these difficulties disappears if, after accepting the fact that the conditions for choosing prepositions are basically of the same type as those for choosing case forms, we merely agree that the determining conditions may simultaneously determine a preposition and a case form. The second difficulty means merely that a correct account will allow certain options in the choice of prepositions in some contexts, and that these choices have semantic consequences. Analogous devices are provided by the 'true' case languages, too, for example by having alternative case choices in otherwise identical constructions, or by having semantically functioning prepositions or postpositions.

The syntactic relations that are involved in the selection of case forms (prepositions, affixes, etc.) are, in practice, of two types, and we may call these 'pure' or 'configurational' relations, on the one hand, and 'labeled' or 'mediated' relations on the other hand.43 'Pure' relations are relations between grammatical

43 The distinction would be more accurately represented by the opposition 'relations' vs. 'categories', because when a
phrase-structure rule introduces a symbol like Manner or Extent, symbols which dominate manner adverbials and extent phrases, these symbols function, as far as the rest of the grammar is concerned, in exactly the same ways as such 'intentional' category symbols as S or NP. This fact has much more to do with the requirements of the phrase-structure model than with the 'categorial' character of the grammatical concepts involved. In an earlier paper I discussed the impossibility of capturing in a base component of a grammar of the type presented in Chomsky (1965) both such information that in a clumsy way is a manner adverbial (and as such represents an instance of highly constrained lexical selection as well as a quite specific positional and co-occurrence potential which it shares with other manner adverbials) and that it is a preposition phrase. See my "Toward a modern theory of case," THE OHIO STATE UNIVERSITY PROJECT ON LINGUISTIC ANALYSIS REPORT NO. 13 (1966) 1-24.

The intention on the part of grammarians who have introduced such terms as Loc, Temp, Extent, etc., into their rules is to let these terms represent relations between the phrases which they dominate and some other element of the sentence (e.g., the VP as a whole); nobody, as far as I can tell, has actually wished these terms to be considered as representing distinct types of grammatical categories on the order of NP or Preposition Phrase.

constituents expressible in terms of (immediate) domination.

Thus, the notion 'subject' can be identified as the relation between a NP and an immediately dominating S, while the notion 'direct object' can be equated with the relation that holds between a NP and an immediately dominating VP. Where the relation 'subject of' is understood to hold between elements of the deep structure, one speaks of the deep-structure subject; where it is understood to hold between elements of the (pre-stylistic) surface structure, one speaks of the surface-structure subject. This distinction appears to correspond to the traditional one between 'logical subject' and 'grammatical subject'.

By 'labeled' relation I mean the relation of a NP to a sentence, or to a VP, which is mediated by a pseudo-category label such as Manner, Extent, Location, Agent, etc.
It is clear that if all transformations which create surface subjects have the effect of attaching a NP directly to a S, under conditions which guarantee that no other NP is also directly subjoined to the same S and if it always turns out that only one NP is subjoined to a VP in the pre-stylistic surface structure, then these two 'pure' relations are exactly what determine the most typical occurrences of the case categories 'nominative' and 'accusative' in languages of a certain type. For remaining case forms, the determination is either on the basis of idiosyncratic properties of specific governing words, or on the basis of a 'labeled' relation, as when the choice of by is determined by reference to the dominating category Extent in the extent phrase of sentences like (17).

(17) he missed the target by two miles

In my earlier paper (see fn. 43) I pointed out that there is no semantically constant value associated with the notion 'subject of' (unless it is possible to make sense of the expression 'the thing being talked about', and, if that can be done, to determine whether such a concept has any connection with the relation 'subject'), and that there are no semantically relevant relations residing in the surface subject relation which are not somewhere also expressible by 'labeled' relations. The conclusion I have drawn from this is that all semantically relevant syntactic relations between NPs and the structures which contain them must be of the 'labeled' type. The consequences of this decision include (a) the elimination of the category VP, and (b) the addition to some grammars of a rule, or system of rules, for creating 'subjects'. The relation 'subject',
in other words, is now seen as exclusively a surface-structure phenomenon.
2. Some preliminary conclusions

I have suggested that there are reasons for questioning the deep-structure validity of the traditional division between subject and predicate, a division which is assumed by some to underlie the basic form of all sentences in all languages. The position I take seems to be in agreement with that of Tesnière, who holds that the subject/predicate division is an importation into linguistic theory from formal logic of a concept which is not supported by the facts of language, and, furthermore, that the division actually obscures the many structural parallels between 'subjects' and 'objects'. The kinds of observations that some scholars have made about surface differences between 'predicative' and 'determinative syntagms' may be accepted without in any way requiring one to believe that the subject/predicate division plays a part in the deep structure syntactic relations among the constituents of sentences.

Once we have interpreted 'subject' as an aspect of the surface structure, claims about so-called 'subjectless' sentences in languages which have superficial subjects in some sentences, or reports about languages which appear to lack entirely entities corresponding to the 'subjects' of our grammatical tradition, no
longer need to be regarded as particularly disturbing. Unfortunately, there are both good and bad reasons for asserting that particular languages or particular sentences are 'subjectless', and it may be necessary to make it clear just what it is that I am claiming. A distinction must be drawn between not having a constituent which could properly be called 'subject', on the one hand, and losing such a constituent by anaphoric deletion, on the other hand. \[46\] Robins, in his review of Tesnière (1959),

---

\[46\] The tagmemicists in particular, because of their notation for 'optional' constituents, have had to come to grips with this distinction. A 'tagmemic formula' may be thought of as an attempt to present in a single statement a quasi-generative rule for producing a set of related sentences and the surface structure (short of free variation in word order) of these sentences. If the formulas for transitive and intransitive clauses are expressed as (i) and (ii) respectively

(i) +Subj +Pred +Obj +Loc +Time
(ii) +Subj +Pred +Loc +Time

just

it is clear (a) that any clause containing a Pred can satisfy either of these formulas, and (b) that the potential appearance of such constituents as Loc and Time are less relevant to the description of these clauses than is that of the constituent Obj. Pike draws a distinction, which cross-cuts the optional/obligatory distinction, between 'diagnostic' and 'non-diagnostic' elements of clauses, as, e.g., in his recent H.E.W. report, TAGMEMIC AND MATRIX LINGUISTICS APPLIED TO SELECTED AFRICAN LANGUAGES (1966), esp. Chapter 1: Clauses. Grimes, on the other hand, seems to suggest introducing the 'diagnostic' constituents obligatorily, allowing for their deletion under certain contextual or anaphoric conditions. See Joseph E. Grimes, HUICHOL SYNTAX, Mouton (1964) Pp. 105, esp. 16f.

---

accuses Tesnière of failing to isolate the subject from the rest of the sentence. To Robins, Tesnière's decision to allow the subject to be treated as being merely a complement to the verb must be related to the fact that the subject is omissible in such languages as Latin. \[47\] If it is true that the omissibility of
'subjects' is what convinced Tesnière that they are subordinated to verbs, and if the non-omissibility in any language of the subject constituent would have persuaded him that there is a special status for 'subject' vis-à-vis 'predicate' in the underlying structure of sentences in all languages, then that, it seems to me, is a bad reason for coming up with what might be a correct analysis.

It seems best to have a place in linguistic theory for the operation of anaphoric processes, processes which have the effect of shortening, simplifying, de-stressing sentences which are partly identical to their neighbors (or which are partly 'understood'). It happens that English anaphoric processes make use of pronominalization, stress reduction, as well as deletion, under conditions where other languages might get along exclusively with deletion.

For an extremely informative description of these processes in English, see Lila Gleitman, "Coordinating conjunctions in English," LANGUAGE XLI (1965) 260-293; also see Zellig S. Harris, "Co-occurrence and transformation in linguistic structure," LANGUAGE XXXIII (1957) 283-340, esp. section 16.

Under some conditions, in languages of the latter type, the deleted element happens to be the 'subject'. The non-occurrence of subject nouns in some utterances in some languages is not by itself, in other words, a good argument against the universality of the subject/predicate division. There are better ones. Some of these
have already been suggested, others are to appear shortly.

By distinguishing between surface and deep structure case relationships, by interpreting the 'subject' and 'object' as aspects of the surface structure, and by viewing the specific phonetic shapes of nouns in actual utterances as determinable by many factors, vastly variable in space and time, we have eliminated reasons for being surprised at the non-comparability of (surface) case systems. We find it partly possible to agree with Bennett when, after surveying a few representative nineteenth century case theories, he stated that they erred in sharing the "doubtful assumption ... that all the cases must belong to a single scheme, as though parts of some consistent institution".\(^49\) We need not follow him, however, in concluding that

\(^49\) Bennett (1914) 3.

the only valid type of research into the cases is to determine the earliest value of each case, taken one at a time.

Greenberg has remarked that cases themselves cannot be compared across languages—two case systems may have different numbers of cases, the names of the cases may conceal functional differences—but that case uses may be expected to be comparable. He predicts, for instance, that the uses of cases will be "substantially similar in frequency but differently combined in different languages."\(^50\) Greenberg's recommendations on the cross-linguistic

\(^50\) Greenberg (1966) 80, 98; the quotation is from p. 98.
study of case uses were presented in connection with the 'true' case languages, but it seems clear that if a 'Dative of Personal Agent' in one language can be identified with an 'Ablative of Personal Agent' in another language, then the 'Personal Agent' relationship between a noun and a verb ought also to be recognizable in the so-called 'caseless' languages on exactly the same grounds. If, furthermore, it turns out that other grammatical facts can be associated with sentences containing the Personal Agent relationship, it would appear that the concepts underlying the study of case uses may have a greater linguistic significance than those involved in the description of surface case systems. These additional facts might include the identification of a limited set of nouns and a limited set of verbs capable of entering into this relationship, and whatever additional generalizations prove to be statable in terms of this classification. Higher level dependencies may be discovered, such as the limitation of Benefactive phrases to sentences containing a Personal Agent relationship in their deep structure.

The question should now be asked, of course, whether we are justified in using the term 'case' for the kind of remote syntactic-semantic relations that are at issue. There is among many scholars a strong feeling that the term should be used only where clear case morphemes are discoverable in the inflection of nouns. To Jespersen, it is wrong to speak of 'analytic' cases, even when there is no 'local' meaning in the preposition phrases, because cases are one thing and preposition-plus-object constructions
are another.\textsuperscript{51} Jespersen's position is colored a little by his belief that the caselessness of English represents a state of progress for which we ought to be grateful.\textsuperscript{52}

\textsuperscript{51}Jespersen (1924) 186.

\textsuperscript{52}Jespersen (1924) 179: "However far back we go, we nowhere find a case with only one well-defined function: in every language every case served different purposes, and the boundaries between these are far from being clear-cut. This, in connection with irregularities and inconsistencies in the formal elements characterizing the cases, serve to explain the numerous coalescences we witness in linguistic history ("syncretism") and the chaotic rules which even thus are to a great extent historically inexplicable. If the English language has gone farther than the others in simplifying these rules, we should be devoutly glad and not go out of our way to force it back into the disorder and complexity of centuries ago." (Italics added.)

Cassidy, in his 1937 appeal to rescue the word 'case' from abuse, wrote: "'Case' will be properly used and will continue to have some meaning only if the association with inflection be fully recognized, and if stretching of the term to include other sorts of 'formal' distinction be abandoned."\textsuperscript{53} In a similar vein,

\textsuperscript{53}Frederick G. Cassidy, "'Case' in modern English," LANGUAGE, XIII (1937) 240-245; 244.

Lehmann chides Hirt for suggesting that an awareness of cases had to precede the development of case endings—that there was, in other words, "among the speakers of pre-Indo-European and Proto-Indo-European a disposition for cases." Lehmann continues: "We can account for Hirt's statement by the assumption that to him a case was a notional category, whether or not it was exemplified
in a form. To us a particular case is non-existent unless it is represented by forms which contrast in a system with others.\textsuperscript{54}

\textsuperscript{54}Lehmann (1958) 185.

The claim that syntactic relations of various types must exist before case endings could be introduced to give them expression would su-erly have gone unchallenged; what was offensive, apparently, was the use of the word 'case'.

It seems to me that if there are recognizable intra-sentence relationships of the types discussed in studies of case systems--whether these are reflected in case affixes or not--and if these same relationships can be shown to be comparable across languages; and if there is some predictive or explanatory use to which assumptions concerning the universality of these relations can be put, then surely there can be no meaningful objection to using the word 'case', in a clearly-understood deep-structure sense, to identify these relationships. The dispute on the term 'case' loses its force in a linguistics which accepts the centrality of syntax.\textsuperscript{55}

\textsuperscript{55}The universality of case as a grammatical category is affirmed in Hjelmlev (1934) 1. A recent study of Velten's, from a Jakobsonian point of view, reveals enough of the historical continuity of 'synthetic' and 'analytic' cases to suggest that the linguist has no right to assign cases and prepositions to different 'chapters' of the study of grammar. (H. V. Velten, "On the functions of French de and à," LINGUA, XI (1962) 449-452.) The deep structure notion of cases may be thought of as involving an extension of the synchronic concept of 'syncretism'. The usual synchronic sense of case syncretism assume the form of a decision to posit a case contrast that may not be expressed overtly in most contexts as long as it appears overtly in "one
part of the system." (See Leonard Newmark's statement in "An Albanian case system," LINGUA, XI (1962) 312-321; 313.) Deep structure cases may simply be nowhere overtly reflected as affixes or function words. The notion we are after probably corresponds to Meinhof's 'Kasusbeziehungen'. (C. Meinhof, "Der Ausdruck der Kasusbeziehungen in afrikanischen Sprachen," SCRITTI IN ONORE DI A. TROMBETTI, Milano (1938) 71-85; 71. The Meinhof reference, which I have not seen, was quoted in Henri Frei, "Cas et dèses en francais," CAHIERS FERDINAND DE SAUSSURE, XII (1954) 29-47; fn. p. 31.)

We may agree, then, for our present purposes, with Hjelmslev, who suggests that the study of cases can be pursued most fruitfully if we abandon the assumption that an essential characteristic of the grammatical category of case is expression in the form of affixes on substantives. I shall adopt the usage first proposed, as far as I can tell, by Blake,56 of using the term 'case' to

56 Frank Blake, "A semantic analysis of case," in CURME VOLUME OF LINGUISTIC STUDIES (LANGUAGE Monograph No. 7) (1930) 34-49.

identify the underlying syntactic-semantic relationship, and the term 'case form' to mean the expression of a case relationship in a particular language—whether through affixation, suppletion, the use of clitic particles, or constraints on word order.
3. Case grammar

The substantive modification to the theory of transformational grammar which I wish to propose amounts to a re-introduction of the 'conceptual framework' interpretation of case systems, but this time with a clear understanding of the difference between deep and surface structure. The sentence in its basic structure consists of a verb and one or more noun phrases, each associated with the verb in a particular case relationship. The 'explanatory' use of this framework resides in the necessary claim that, although there can be compound instances of a single case (through noun phrase conjunction), each case relationship occurs only once in a simple sentence.57

57 It follows that whenever more than one case form appears in the surface structure of the same sentence (on different noun phrases), either more than one deep-structure case is involved or the sentence is complex. If, for example, German lehren is described as a verb which 'takes two accusatives', we have reason to believe that in the deep structure, the two object nouns are distinct as to case. Often enough the language will provide evidence for the distinction, as in the occurrence of such passive sentences as das wurde mir gelehrt.

It is important to realize that the explanatory value of a universal system of deep-structure cases is of a syntactic and not (merely) a morphological nature. The various permitted arrays of distinct cases occurring in simple sentences expresses a notion of 'sentence type' that may be expected to have universal validity, independently of such superficial differences as subject selection. The arrays of cases defining the sentence types of a language have the effect of imposing a classification of the verbs in the language (according to the sentence type into which they may be
inserted), and it is very likely that many aspects of this classification will be universally valid.

Case elements which are optionally associated with specific verbs, together with the rules for forming subjects, will serve to explain various co-occurrence restrictions. For example, in (18) the subject is in an Agent relation to the verb, in (19) the subject is an Instrument; and in (20) both Agent and Instrument appear in the same sentence, but in this case it is the Agent which appears as the subject, not the Instrument.

(18) John broke the window
(19) a hammer broke the window
(20) John broke the window with a hammer

That the subjects of (18) and (19) are grammatically different explains the fact that the combined meanings of the two sentences is not produced by conjoining their subjects. Thus (21) is unacceptable.

(21) *John and a hammer broke the window

Only noun phrases representing the same case may be conjoined. Similarly, the fact that only one representative of a given case relationship may appear in the same simple sentence, together with the generalizations on subject selection and the redundancies which hold between cases and lexical features (e.g., between Agent and animateness), explains the unacceptability of sentence (22).

(22) *a hammer broke the glass with a chisel

It is unacceptable, in particular, on the interpretation that both hammer and chisel are understood instrumentally. It cannot represent a sentence containing an Agent and an Instrument, since the
noun hammer is inanimate. 58

58 The author is aware that in sentence (18) one might be talking about what John's body did as it was tossed through the window and that in sentence (19) one might be speaking metaphorically, personifying hammer. Under either interpretation sentence (21) turns out to be acceptable, and under the personification interpretation, sentence (22) becomes acceptable. What is important to realize is that these interpretations, too, are explainable by reference to exactly the same assumptions appealed to in explaining their 'face value' interpretations.

The dependencies that can be accounted for by making these assumptions are that the subject of an active transitive sentence must be interpretable as a Personal Agent just in case the sentence contains a with-phrase of Instrumental import. Apparent exceptions to this generalization can be seen to have different underlying structures. Sentence (23) looks like an exception, but by attending to the effect of the word its, the essential difference between (23) and sentences (22) and (24) becomes apparent.

(23) the car broke the window with its fender
(24) *the car broke the window with a fender
Sentence (24) violates the conditions that have been discussed, but sentence (23) is a paraphrase of sentence (25) and may be interpreted as having the same deep structure as (25).

(25) the car's fender broke the window

What is suggested here is that sentences (23) and (25) are Agentless sentences containing a possessed noun as the Instrument (the car's fender). The rules for choosing a subject allow an option in this case: either the entire Instrument phrase may appear as the subject (as in (25)), or the 'possessor' alone may be made
the subject, the remainder of the Instrument phrase appearing
with the preposition with (as in (23)). The second option
requires that a 'trace' be left behind in the Instrument phrase,
in the form of the appropriate possessive pronoun. A similar
explanation is suggested for such sentences as (26) and (27), which
are also interpretable as deep-structurally identical.

(26) your speech impressed us with its brevity
(27) the brevity of your speech impressed us

The superficial nature of the notion 'subject of a sentence' is made
apparent by these examples in a particularly persuasive way, because
in the possessor-as-subject cases, the 'subject' is not even a major
constituent of the sentence; it is taken from the modifier of one
of the major constituents.

In the basic structure of sentences, then, we find what might
be called the 'proposition', a tenseless set of relationships invol-
v ing verbs and nouns (and embedded sentences, if there are any),
separated from what might be called the 'modality' constituent.
This latter will include such modalities on the sentence-as-a-whole
as negation, tense, mood and aspect.\footnote{There are probably good reasons for regarding negation, tense and
mood as associated directly with the sentence as a whole, and the
perfect and progressive 'aspects' as features on the V. See for
a statement of this position Lyons (1966) 218, 223.}

\footnote{There are probably good reasons for regarding negation, tense and
mood as associated directly with the sentence as a whole, and the
perfect and progressive 'aspects' as features on the V. See for
a statement of this position Lyons (1966) 218, 223.}

The exact nature of the

modality constituent may be ignored for our purposes. It is likely,
however, that certain 'cases' will be directly related to the
modality constituent as others are related to the proposition itself,
as for example certain temporal adverbs.\footnote{60}
In my earlier paper I suggested that sentence adverbials in general are assigned to the modality constituent. I now believe that many sentence adverbs are introduced from superordinate sentences (by transformations of a type we may wish to call 'infrajections'). This possibility has long been clear for unmistakable sentence adverbs like *unfortunately*, but there are also quite convincing reasons for extending the infrajection interpretation to adverbs like *willingly*, *easily*, *carefully*, etc.

The first base rule, then, is (28), abbreviated to (28').

(28) Sentence → Modality + Proposition
(28') S → M + P

The arrow notation is used throughout, but this should not be interpreted as meaning that the proposal for a case grammar requires an assumption of a left-to-right orientation of the constituent symbols of the rewriting rules.

The P constituent is 'expanded' as a verb and one or more case categories. A later rule will automatically provide for each of the cases the categorial realization as NP (except for one which may be an embedded S). In effect the case relations are represented by means of dominating category symbols.

The expansion of P may be thought of as a list of formulas of the form (29), where at least one case category must be chosen and in which no case category appears more than once.

(29) P + V + C₁ + ... + Cₙ

Whether these formulas can be collapsed according to the familiar abbreviatory conventions is not at present clear. For our purposes we may simply think of P as representable by any of a set of formulas including V + A, V + O + A, V + D, V + O + I + A, etc. (The letter symbols are interpreted below.)
The case notions comprise a set of universal, presumably innate, concepts which identify certain types of judgments which human beings are capable of making on the events that are going on around them, judgments on such matters as who did it, who it happened to, what got changed, etc. The cases that appear to be needed include:

Agentive (A), the case of the perceived instigator of the action identified by the verb, typically animate.  

Instrumental (I), the case of the inanimate force or object causally involved in the action or state identified by the verb.

Paul Postal has reminded me of the existence of sentences like (i)

(i) I rapped him on the head with a snake.

The requirement that Instrumental NPs are 'inanimate' is the requirement to interpret (i) as having in its underlying structure something equivalent to the body of a snake. The fact that there are languages which would require mention of a stem meaning 'body' in this context may be considered as support for this position; and so may the absence, pointed out by Lakoff, of sentences like (ii)

(ii) *John broke the window with himself

(See George Lakoff, "Instrumental adverbs and the concept of deep structure," unpublished dittographed manuscript, 1967.)

Dative (D), the case of the animate being affected by the state or action identified by the verb.

Factive (F), the case of the object or being resulting from the action or state identified by the verb, or
understood as a part of the meaning of the verb.  

**Locative** (L), the case which identifies the location or spatial orientation of the state or action identified by the verb.

**Objective** (O), the semantically most neutral case, the case of anything representable by a noun whose role in the action or state identified by the verb is identified by the semantic interpretation of the verb itself; conceivably the concept should be limited to things which are affected by the action or state identified by the verb.  

The term is not to be confused with the notion Direct Object, nor with the name of the surface case synonymous with Accusative.

Additional cases will surely be needed. Suggestions for adding to this list will appear in various places below.

It is important to notice that none of these cases can be interpreted as matched by the surface-structure relations Subject or Object in any particular language. Thus, **John** is A in (29) as much as in (30); **the key** is I in (31) as well as in (32) or (33); **John** is D in (34) as well as in (35) and (36); and **Chicago** is L in both (37) and (38).

(29) John opened the door

(30) the door was opened by John
(31) the key opened the door
(32) John opened the door with the key
(33) John used the key to open the door
(34) John believed that he would win
(35) we persuaded John that he would win
(36) it was apparent to John that he would win
(37) Chicago is windy
(38) it is windy in Chicago

The list of cases includes L, but nothing corresponding to what might be called Directional. There is a certain amount of evidence, as was mentioned above, that locational and directional elements do not contrast but are superficial differences determined either by the constituent structure or by the character of the associated verb. An example provided by Hall (39) suggests, by the occurrence of the pro-replacement word there, that to the store and at the store are variants of the same entity, determined by the movement or non-movement character of the associated verb. 65

(39) she took him to the store and left him there

65 Barbara Hall (now Barbara Hall Partee), SUBJECT AND OBJECT IN ENGLISH, M.I.T. Ph. D. Dissertation (1965) 77.

The putative contrast between locational and directional expressions as well as the distinction between 'optional' and 'obligatory' locative expressions, as exemplified in Hall's examples (i) and (ii) seem to point to the difference between elements which are 'inside the VP' and elements which are 'outside the VP'.

(i) John keeps his car in the garage
(ii) John washes his car in the garage

In our terms this would be equivalent either to determining whether there is a difference between a L as a constituent of P and a L as a constituent of M, or whether there can be two L elements within P, distinguished in terms of degree of selectivity of verbs. The highly restricting L selects verbs like keep, put and leave, but
not polish, wash and build; the weakly restricting L selects verbs like polish, wash and build, but not believe, know or want.

However this distinction is interpreted, the second or 'outer' L is in some respects similar in its 'selectional' properties to what might be called the Benefactive case (B). B, too, is involved in the selection of verbs in the sense that some verbs do not accept B modification ("he is tall for you"); but the restriction here may have more to do with dependency relations between cases than with dependencies directly connected with the verb. It appears, in fact, that those verbs which allow 'outer' L and B modification are precisely those which take Agents. I have no ideas on how these dependencies can be stated, but it would appear that the second L and the B can appear only in sentences containing A's.

Thus the régime direct vs. régime indirect interpretation of the difference between (iii) and (iv)

(iii) il demeure à Paris
(iv) il travaille à Paris

may have simply to do with the fact that the subject of (iv) is actually an A. Both the specific verb and the occurrence of an 'outer' L are determined by the presence of an A. (See, in this connection, Bazell's discussion of Gougenheim's review of de Boer's French syntax in C. E. Bazell, "Syntactic relations and linguistic typology," CAHIERS FERDINAND DE SAUSSURE, VIII (1949) 5-20; 10.)

I have stated that A and D are 'animate' participants in the activity of the associated verbs, and I have also suggested that verbs are selected according to the case environments which the sentence provides—what I shall refer to as the 'case frame'.

There are, then, the two problems of lexical selection, that of the nouns and that of the verbs. Those features of nouns required by a particular case are to be specified by obligatory rules of the type illustrated by (39), a rule which specifies that any N in an A,D

(39) N \rightarrow [+Animate] / [X_ Y ]

A or D phrase must contain the feature [+Animate]. (Recall the qualification of fn. 62.)

To take care quite generally of lexical features associated with specific cases, we may appeal to a rule which associates with each noun a label which identifies the case relation which
it holds with the rest of the sentence. Such a rule might associate with every noun under L the feature [+Locative], for example. Since abstract nouns such as idea cannot serve as heads of L expressions, they will be marked [-Locative].

By allowing highly restricting lexical features to be associated with given case units we have returned to that extension of 'cases' to 'adverb forms' proposed by Bopp, Wüllner and Hartung. Some adverbs, on this view, are really nouns capable of 'taking' only one case form. Since deep structure cases are in fact all 'defective' to some extent, with respect to the nouns which they accept, such a concept as inflectional scope no longer provides a clear demarcation between 'case forms proper' and 'adverbs'. See the discussion of this question in Hjelmslev (1935) 40.

The insertion of verbs, on the other hand, depends on the particular array of cases, the 'case frame', provided by the sentence. The verb run, for example, may be inserted into the

I am adhering, in this discussion, to the Postal-Lakoff doctrine, which I find thoroughly convincing, that adjectives constitute a subset of verbs. See George Lakoff, ON THE NATURE OF SYNTACTIC IRREGULARITY, Harvard Computation Laboratory, Report No. NSF-16, Mathematical Linguistics and Automatic Translation (1965), Appendices.

frame [__A], the verb sad into the frame [__D], verbs like remove and open into [__O+A], verbs like murder and terrorize (i.e., verbs requiring 'animate subject' and 'animate object') into [__D+A], verbs like give into [__O+D+A], and so on.

In lexical entries for verbs, abbreviated statements called 'frame features' will indicate the set of case frames into which the given verbs may be inserted. These frame features have the effect of imposing a classification of the verbs in the language.
The classification has the complexity it does not only because of the variety of case environments possible within P, but also because many verbs are capable of occurring in more than one distinct case environment. This last fact can be represented most directly by allowing facultative representation of cases in the frame feature expressions.

The word open, to take a familiar example, can occur in

[__O__], as in (40); in [__O+A__], as in (41); in [__O+I__],
as in (42); and in [__O+I+A__], as in (43).

(40) the door opened
(41) John opened the door
(42) the wind opened the door
(43) John opened the door with a chisel

The simplest representation of this set of possibilities makes use of parentheses to indicate the 'optional' elements. The frame feature for open may thus be represented as (44).

(44) [+[__O(I)(A)__]68

68Case frames are represented in square brackets, with 'underline' indicating the position of the element with respect to which the expression is an environmental frame. A frame feature is represented in square brackets with '+' or '-' in front, indicating that the set of case frames represented by the expression within the brackets are those which will (if the feature is marked '+') or which will not (if the feature is marked '-') accept the lexical item with which the feature is associated.

Other verbs having this same feature are turn, move, rotate, bend, etc.
For a verb like kill it is necessary to indicate, expressing it in familiar terms, that it takes an animate object and either an animate or an inanimate subject; and that if there is an animate subject, an instrument phrase may also co-occur. The frame feature for kill, in other words, will have to specify that either an Instrument or an Agent must be specified, and both may. If the linked parentheses notation can be introduced to indicate that at least one of the linked elements must be chosen, the frame feature for kill can be given as (45).

\[(45) \:+[ \_ \_ D (I)[A] ]\]

The verb murder, on the other hand, is one which requires an Agent. Its frame feature differs from that of (44) and (45) because the element A is obligatorily present. It is given as (46).

\[(46) \:+[ \_ \_ D (I) [A] ]\]

The environmental subclassification of verbs is sensitive to more than the mere array of cases in \(P\). Since one of the cases may be represented by S (an embedded sentence), verbs are also subclassified in terms of whether the 0 element is a sentence. By convention we shall interpret the symbol 0 in frame features as indicating NPs, and the symbol S as indicating an 0 to which an S has been embedded.

The frame feature \(+[ \_ \_ S ]\) characterizes such verbs as true, interesting, etc.; the feature \(+[ \_ \_ S + D ]\) is common to such verbs as want and expect; verbs like say, predict and cause appear in the frame \([ \_ \_ S + A ]\); and verbs like force and persuade are insertable into the frame \([ \_ \_ S + D + A ]\).
It should be pointed out that descriptions of embedded sentences as it + S realizations of the category NP in 'subject/object' grammars must somehow guarantee that this particular expansion of NP is limited to the subjects of intransitive sentences and the objects (direct or oblique) of transitive sentences. All such restrictions are rendered unnecessary by the decision to limit complement S to the case element 0.

Verbs are distinguished from each other not only by specification of the case frames into which they can be inserted, but also by their transformational properties. The most important variables here include (a) the choice of a particular NP to become the surface subject, or the surface object, wherever these choices are not determined by a general rule; (b) the choice of prepositions to go with each case element, where these are determined by idiosyncratic properties of the verb rather than by a general rule; and (c) other special transformational features, such as, for verbs taking S complements, the choice of specific complementizers (that, -ing, for to, etc.) and the later transformational treatment of these elements.

The use of parentheses in expressing the frame features, together with the transformational introduction of subjects, makes it possible to reduce the number of semantic descriptions in the lexicon. The semantic interpretation of a P will introduce all information provided by specific case relationships represented in the P, allowing such information to be omitted from the semantic descriptions of verbs. In the case of verbs having the feature (44), as we have seen, certain related transitive and intransitive verbs need not be given separate semantic description. This point may be further demonstrated with the English verb *cook*. The frame
feature of cook is presumably something like (47)

\[(47) +[\_\_\_ O (A)]\]

and an idiosyncratic transformational feature of the verb is that just in case the A is present and the O is some NP representing a typical NP for the verb (i.e., something like food or a meal), the O element may be deleted. The semantic description of the verb will do no more than identify a particular activity having a result of a particular kind on the object identified by the O element. The same semantic entry, in other words, will account for the use of cook in all of the sentences (48) - (50).

\[(48) Mother is cooking the potatoes\]
\[(49) the potatoes are cooking\]
\[(50) Mother is cooking\]

Instead of saying that the verb has three different meanings, we can be satisfied to say that there is a certain variety in the case frames which accept it, and that is is one of the 'deletable object' verbs. The fact that A is obligatorily animate and that O is unspecified for animateness accounts for the fact that if we can read sentence (49) as ambiguous, it is because we can accept certain violations of grammatical requirements in 'personifications' of the type we have learned in nursery school, whereas if we accept (50) as in fact ambiguous, it is because we are acquainted with the range of activities found in human societies.

The example with cook shows that the lexicon need not contain as many semantic entry tokens under the present proposal as it would in a subject/object grammar. It will now be shown that
It may appear that facultative representation of cases in frame features has the advantages it does in English because there are so many verbs which can be used transitively or intransitively in the same form. It is a language-particular coincidence that English uses the same form in these words. The identification of transitive and intransitive open, or transitive and intransitive cook, is justified because the semantic characterization of the verb is the same in all of the uses discussed. (We must distinguish between the semantic characterization of a verb and the semantic interpretation of sentences containing the verb. In the latter case, all of the co-constituents and the semantic role they play as determined by their cases are taken into account.) Wherever that condition can be satisfied, facultative representation is called for. It will turn out that for some languages the occurrence or non-occurrence of one of the 'optional' cases will have an effect on the verb. If, for verbs of the type \([ \_ \_ O (A) ]\), the appearance of the A determines a variant of the verb different from that when A is missing (distinguishing the 'transitive' from the 'intransitive' use of the 'same' verb), or if the absence of the A requires some additive element (e.g., a 'reflexive' morpheme) not needed when the A is expressed, these facts can be provided transformationally. See Mantaro J. Hashimoto, "The internal structure of basic strings and a generative treatment of transitive and intransitive verbs," paper read before the 1966 Tokyo International Seminar in Linguistic Theory. (By extending the range of acceptable surface variants of verbs under these conditions to suppletion, it may even be possible to interpret the contrasts exemplified in (51) - (53) below as surface lexical variation.)

this same flexibility makes it possible to reduce the number of semantic entry types, for now it is feasible to show that some syntactically different words are in fact semantically identical (with respect to that aspect of their meanings which are independent of the contribution of the associated cases). This may be true for verbs like \(\text{like}\) and \(\text{please}\), to give the example that comes most quickly to mind. These words may be described as being synonymous and each having the frame feature \([ \_ \_ O + D ]\), differing only in their subject selection features. The verb
like, in fact, has in its history the subject selection feature possessed by please.

The verb show, to give another kind of example, might well have the same semantic representation as see, differing from it only in that the frame feature for show contains an A where that for see does not. The verbs kill and die appear to be related in a similar way.

(51) see (+[ _ O + D ]) vs. show (+[ _ O + D + A ])
(52) die (+[ _ D ]) vs. kill (+[ _ D (I A) ])

We have seen, then, instances of synonymy where there are identical frame features but different subject selection features, and instances of synonymy where there are frame feature differences depending on whether a particular case category was present or absent. We may now turn to examples of synonymy where the difference is in the choice of one case or another.

It will be recalled that both A and D are animate. The semantic descriptions of certain verbs may refer to the animateness of the associated noun, independently of whether the 'source' of the animateness is A or D. That is, the semantic representation of certain verbs may specify a relationship or a process associated with the necessarily-animate participant in the state or activity identified by the verb. The relation of hear and listen to the necessarily-animate NP is the same in both cases, the difference in the semantic interpretation of the Ps containing them determined by the semantic contribution of the associated cases, and by the fact that the frames that contain hear are [ _ O + D ] and those that contain listen are [ _ O + A ]. The fact that in the case
of listen the relationship is understood as involving the active participation of the person identified as A is due to the presence of A, not to a special meaning of listen. The same distinction can be seen between see and know, on the one hand, and look and learn, on the other.

\[(53) \textit{see, know (} \dagger\text{O + D} \text{)} \text{ vs. look, learn (} \dagger\text{O + A} \text{)}\]

This latest point leads one to those properties of English verbs with which Lakoff associates the terms 'stative' and 'non-stative'.\textsuperscript{71} The question we need to ask is whether Lakoff's

features are primitives in the lexical entries for verbs, or whether they permit reduction to concepts of the type I have been outlining. Lakoff has noticed that the 'true imperative', the progressive aspect, the occurrence of Benefactive (B) phrases, and do so substitution occur only with 'non-stative' verbs. Lakoff's discussion suggests that one must assign 'stative' and 'non-stative' as features on verbs and then guarantee that B phrases are permitted only with 'non-statives' (put the other way around, one must guarantee that the presence of a B expression allows only for the selection of 'non-statives'), that the imperative transformation can be applied only if the verb is 'non-stative' and so on. The treatment that I prefer is implicit in what I have already presented. The transformation which accounts for the
'true imperatives' can apply only to sentences containing As, and the occurrence of B expressions (and 'outer Ls') is dependent on the presence of an A. The progressive aspect can only be chosen in association with particular case frames, for example, those containing As. No special features indicating stativity need be added to verbs, because (if this suggestion is correct) only those verbs which occur in Ps containing As will show up in these sentences anyway.\(^72\)

\(^{72}\)The do-so evidence is not so easy to interpret in this way. Still, the connection between 'non-stative' verbs and verbs that can 'take' A is too compelling to be simply wrong.

3.5 Surface phenomena

To recapitulate, our discussion so far has suggested that the deep structure of (the propositional component of) every simple sentence is an array consisting of a V plus a number of NPs holding special labeled relations (cases) to the sentence, where these relations are provided for categorially and include such concepts as Agentive, Instrumental, Objective, Factive, Locative, Benefactive, and perhaps several others. Complex sentences involve recursion through the category Sentence under the case category Objective. Verbs are subclassified according to the case environments which accept them, and the semantic characterizations of verbs relate them either to specific case elements in the environment or to elements containing features (such as animateness) introduced as obligatory accompaniments of particular cases.
The present section will deal with some of the ways in which deep structures of the type proposed in this essay are converted into surface representations of sentences. The various mechanisms involve selection of overt case forms (by suppletion, affixation, addition of prepositions or postpositions), 'registration' of particular elements in the verb, subjectivalization, objectivalization, sequential ordering, and nominalizations.

A surface case system may be related to the set of underlying cases in a variety of ways. Two deep cases may be represented in the same way in the surface structure, as when D and O direct objects are both represented with the 'accusative' case in many languages (where the determining factor may be occurrence immediately after the verb at some stage of derivation). A and D may be represented by the same overt form, where the determining factor may be the case-linked animateness. Or the superficial form of a case element may be determined by an idiosyncratic property of some governing word.

The rules for English prepositions may look something like this: the A preposition is by; the I preposition is by if there is no A, otherwise it is with; the O and F prepositions are typically zero; the B preposition is for; the D preposition is typically to; the L and T (for Time) prepositions are either semantically non-empty (in which case they are introduced as optional choices from the lexicon) or they are selected by the particular associated noun (on the street, at the corner (=intersection of two streets), in the corner (of a room); on Monday, at noon, in the afternoon). Specific
verbs may have associated with them certain preposition-choice requirements, introduced as exceptions to the above generalization. 73

73 The verb blame, for example, chooses ('governs') for for 0 and on for D. The 0 preposition is at for look meaning 'examine', for for look meaning 'seek', to for listen, etc. Changes in the original preposition assignment may be brought about by transformations: the rules which provide surface subjects and direct objects delete prepositions (replace them by zero), and the rules which form deverbal (=desentential) nominals convert some of the original case forms into 'genitive', either by replacing the assigned preposition with of, or, in some cases, removing the original preposition and affixing the 'genitive' suffix.

The position of prepositions can be guaranteed either by having the case categories re-written as Prep + NP, or by having Prep be one of the obligatory constituents of NP. I shall make the former choice, though the grounds for making the decision one way or the other are not particularly clear. The 'universal' character of the base rules is kept intact by the assumption that prepositions, postpositions, and case affixes--semantically relevant or not--are all in fact realizations of the same underlying element, say K (for Kasus). We may regard all of the case categories as therefore rewritten as K + NP.

Every English sentence has a surface subject, if only formally so. For most combinations of cases there is a 'preferred' or 'unmarked' subject choice; for some there is no actual choice--the subject is uniquely determined. In general the 'unmarked' subject choice seems to follow the following rule:

(54) If there is an A, it becomes the subject; otherwise, if there is an I, it becomes the subject; otherwise, the subject is the 0.
Suppose, for example, that the base representation of a particular sentence is item (55):

(55)

Since the sentence contains only one case category, it is obligatorily moved to the front (and hence directly subjoined to the category S) where it will later undergo subject-preposition deletion. There is a stage, in other words, where the form of the sentence in question is that represented in (56).

(56)

The subject-preposition deletion rule removes the preposition and deletes the case label. After application of the subject-preposition deletion rule, the form of the sentence is that represented in (57).
The final surface form, shown in (58), results from incorporation of the tense into the verb.

For a base configuration containing an A a distinction must be made between the 'normal' and the 'non-normal' choice of subjects.

---

The choice of terms is not to be taken seriously.

The choice of the A as the subject, in accordance with the rule proposed in (54) above, requires no modification of the verb. The changes from (59) to (60) represent subject-fronting, those from (60) to (61) show subject-preposition deletion, and those from (61) to (62) indicate the effect of a third rule, object-preposition deletion. The eventual surface structure of the sentence whose deep

---

Verbs are categorized according to whether they delete the preposition of the following case category, i.e., whether they 'take on' a direct object. The object-preposition deleting property of a verb may be modified by a transformation.
structure is (59) is (63).

(59)

\[
S \rightarrow M \rightarrow V \rightarrow O \rightarrow K \rightarrow \text{NP} \rightarrow d \rightarrow N \rightarrow \text{NP} \\
past \rightarrow \text{give} \rightarrow \emptyset \rightarrow \text{the} \rightarrow \text{books} \rightarrow \text{to} \rightarrow \text{my} \rightarrow \text{brother} \rightarrow \text{by} \rightarrow \text{John}
\]

(60)

\[
A \rightarrow S \rightarrow M \rightarrow V \rightarrow K \rightarrow \text{NP} \rightarrow d \rightarrow N \rightarrow \text{NP} \rightarrow \text{NP} \\
\rightarrow \text{by} \rightarrow \text{John} \rightarrow \text{past} \rightarrow \text{give} \rightarrow \emptyset \rightarrow \text{the} \rightarrow \text{books} \rightarrow \text{to} \rightarrow \text{my} \rightarrow \text{brother}
\]

(61)

\[
NP \rightarrow M \rightarrow V \rightarrow K \rightarrow \text{NP} \rightarrow d \rightarrow N \rightarrow \text{NP} \rightarrow \text{NP} \\
\rightarrow \text{John} \rightarrow \text{past} \rightarrow \text{give} \rightarrow \emptyset \rightarrow \text{the} \rightarrow \text{books} \rightarrow \text{to} \rightarrow \text{my} \rightarrow \text{brother}
\]
If it is noted that the verb give is one which, with A as subject, allows either O or D to become the direct object, an alternative surface form for (59) is (64) (assuming that case-label deletion occurs when zero K elements are ‘deleted’).

The 'normal' choice of subject for sentences containing an A, as stated in generalization (54) (which is a generalization for
English) is the A. The verb give also allows either O or D to appear as subject as long as this 'non-normal' choice is 'registered' in the V. This 'registering' of a 'non-normal' subject takes place via the association of the feature [+Passive] with the V. This feature has three effects; the V loses its object-preposition deletion property, it loses its ability to absorb the tense (requiring the automatic insertion of a be in the M constituent), and it must now be filled by a special 'passive' form (i.e., given). The sequence (65) to (68) develops the choice of O as subject; the sequence (69) to (73) shows the result of choosing D as subject.

```
We have seen that where there is only one case category, its NP must serve as the surface subject. Examples (59) to (73) have shown ways of dealing with sentences containing more than one case category where one designated case could provide the subject without effecting any change in the V, or others could do so as long as a 'record' of this decision was attached to the V.

For many of the verbs which 'take' more than one case category, the one which contributes the subject is indicated by the verb
itself. Of the verbs which are accepted into the frame [ _ O + D ], please, belong, interesting, etc., choose O as subject, like, want, think, etc., choose D. 76

76 As mentioned above, by regarding the differences here as representing no more than idiosyncratic facts about the syntactic properties of these verbs, we can accept historical changes like those with like, want and think, from verbs of the type which choose O to verbs of the type which choose D, to be merely a matter of detail in the subject-selection processes in our language. In other words, we do not need to agree with Jespersen when he describes the change in English from the use of expressions of the type him like oysters to those of the type he likes oysters as reflecting a change in the 'meaning' of the verb like from something like "to be agreeable to" to something like "to take pleasure in" (Jespersen 1924: 160). The change seems merely to be a result of the inter-influencing of the two surface processes of choosing the first word and establishing verbal concord.

Sometimes subjects are created not by moving one of the case elements into the 'subject' position, but by copying a particular element into that position. This seems to be a consequence of the positional treatment of subjects in English and seems to be related to the use of purely formal subjects. 77

77 From the fact that there may only be one case in a simple sentence, it becomes possible to allow all subjects to be formed by a copying transformation. Sentences with two copies of the same NP in the same case undergo one of a number of changes: the second copy is either deleted or replaced by a pro-form, or the first copy is replaced by a pro-form.

Copying for pro-replacement can be illustrated with that-clauses. The 'verb' true occurs in the frame [ _ S ], i.e., in the configuration (74).

(74)

\[
\begin{array}{c}
\text{P} \\
\text{V} \\
\text{O} \\
\text{S}
\end{array}
\]
Since there is only one case element, it is obligatorily the subject. The context requires that the complementizer that be provided for the embedded sentence. By subject copying, (76) is derived from (75).

(75)

```
S
├── M
│   │
│   ├── V
│   │   │
│   │   └── O
│   └── P
│       │
│       └── S
│           │
│           └── pres
└── true
    │
    └── that John likes Mary
```

(76)

```
S
├── M
│   │
│   ├── V
│   │   │
│   │   └── O
│   └── P
│       │
│       └── S
│           │
│           └── that John likes Mary
├── S
 │   │
 │   ├── V
 │   │   │
 │   │   └── O
 │   └── P
 │       │
 │       └── S
 │           │
 │           └── that John likes Mary
│           │
│           └── pres
└── true
```

The structure of (76) undergoes either second-copy deletion, yielding (77), or first-copy pro-replacement, giving us (78).

(77)

```
S
├── O
│   └── M
│       │
│       └── V
│           │
│           └── P
│               │
│               └── S
│                   │
│                   └── that John likes Mary
│                   │
│                   └── pres
│                       │
│                       └── true
```

(78)
Verbs expressing meteorological conditions have the frame feature +[ _ L ]. Choosing hot in that frame, we can construct the sentence whose deep structure is represented by (79). From (79) we get, by subject copying, item (80). By second copy deletion (and subject preposition deletion) item (80) becomes (81); on the other hand, if the first copy is replaced by its pro-form (in this context, it), the resulting sentence is (82).  

78It is likely that the correct analysis of subject copying is a little different from this. There is considerable evidence that when the first copy is replaced by its pro-form, the second copy is actually outside of P, that is, that it is 'extraposed' in the sense of Rosenbaum. If this is true, then since the sentences having undergone extraposition must be created in two steps anyway, it is likely that the sentential subjects are formed in the usual way—not by copying—and that they are later extraposed, leaving behind, in the subject position, a 'trace' in the form of expletive it.

The examples and the analysis of meteorological verbs are adapted from D. Terence Langendoen, "Some problems concerning the English expletive 'it'," THE OHIO STATE UNIVERSITY RESEARCH FOUNDATION, PROJECT ON LINGUISTIC ANALYSIS, REPORT NO. 13 (1966), 104-134.
(80)

\[
S \leftarrow L_{K} \rightarrow M_{NP} \rightarrow P \rightarrow V_{K} \rightarrow L_{NP} \\
\text{in the studio} \quad \text{pres} \quad \text{hot} \quad \text{in the studio}
\]

(81)

\[
S \leftarrow NP_{d} \rightarrow M_{NP} \rightarrow P \rightarrow V_{K} \rightarrow L_{NP} \\
\text{the studio} \quad \text{is} \quad \text{hot}
\]

(82)

\[
S \leftarrow NP_{d} \rightarrow M_{V} \rightarrow P \rightarrow L_{K} \rightarrow NP_{d} \rightarrow N \\
\text{it} \quad \text{is} \quad \text{hot in the studio}
\]

Under certain conditions, a first-copy L may be replaced by an expletive there. The case frame [ ] O + L may be filled by a blank verb (i.e., zero). This situation (of verbless sentences) may call for the introduction of the element be into the M constituent, which is a process we have already seen to be necessary for verbs which are adjectives as well as for verbs which have been modified through addition of the feature [+Passive]. For verbless
sentences of the type \([0 + L]\), the 'normal' subject choice is 0. Thus, from (83) we get (84), and eventually (85).

(83)

\[
S \quad P \quad O \\
V \quad K \quad NP \\
\text{pres} \quad \emptyset \quad \emptyset \quad \text{many toys} \\
\]

(84)

\[
S \quad M \quad P \\
O \quad K \quad NP \\
\emptyset \quad \text{many toys} \quad \text{pres} \quad \emptyset \quad \text{in the box} \\
\]

(85)

\[
S \quad M \quad L \\
NP \quad d \quad N \\
\text{many toys} \quad \text{are} \quad \text{in the box} \\
\]

An alternative subject choice, through subject-copying, is the L. Thus, from (83) we might get (86).
The pro-form for L in verbless sentences is expletive (unstressed) there. The result of modifying (86) by pro-replacement of the subject L is (87); extraposition of the second-copy L, as suggested in fn. 78, has been carried out in (87).

Alternatively to replacing the first-copy L by expletive there is to retain the L NP as subject. This decision requires the regular pronominalization of the repeated NP. It further requires modification of the verb: the hitherto empty V position is filled with the function verb have. Since have is a V, it is capable of absorbing

---

79 For a recent argument on the transformational introduction of be and have in all of their occurrences, see Emmon Bach, "Have and be," LANGUAGE, forthcoming. For a more adequate treatment of existential sentences than I have presented, see especially P. Gregory Lee, "Some properties of be sentences," 1967 forthcoming.
the tense, making the addition of be to M no longer necessary. The result of choosing the first L as subject results, through subject-preposition deletion, have-insertion, object-preposition deletion, repeated NP pronominalization, and tense affixation, in (88).

(88)

The general position I am taking on the verb have is that in verbless sentences (i.e., when the V constituent is present but lexically empty), have is obligatorily inserted just in case the subject is a NP which is not from the case 0. The most obvious case is that of the empty verb in the frame [ _ O + D ], a context which in English requires D to be the subject, resulting in the typical have sentences. Other languages, e.g., French, seem to have contexts in which the subject choice is optional—situations where X a Y is in a paraphrase relation with Y est à X. Other languages, e.g. Estonian, do not have anything equivalent to the verb have. 80

---

80 Another situation for introducing have, accounting for connections between such pairs of sentences as (i) and (ii), are discussed below in the section on inalienable possession.

(i) my knee is sore
(ii) I have a sore knee

Some languages have subjectivalization processes; and, as I have suggested for English, there seems to be an analogous objectivalization
process which has the superficial effect of bringing a particular nominal element into closer association with the verb.

The formal rather than purely notional character of the direct object was noticed by Jespersen. His examples show intra-language paraphrase relations like that between (89) and (90), and cross-language differences like that between (91) and (92).

(89) present something to a person
(90) present a person with something
(91) furnish someone with something
(92) fournir quelque chose à quelqu'un

When such phenomena were examined by Hall, she took one form as basic, the other as derived. 'Derived subjects', in her analysis, are possible just in case there is no 'deep subject'; 'derived objects', on the other hand, have the effect of displacing the original deep structure object and attaching a with to it. Her examples include (93)-(94) and (95)-(96).

(93) John smeared paint on the wall
(94) John smeared the wall with paint
(95) John planted peas and corn in his garden
(96) John planted his garden with peas and corn

Hall provides rules which move the locative element (the wall or his garden of (93) and (95) respectively) into the direct object position by a transformation which also attaches with to the former direct object.
From the point of view taken here, it would be just as easy to say that both on the wall and with paint were initially provided with prepositions (as L and I case elements), the verb smear having the property that whichever of these elements is chosen as 'direct object' is drawn next to it and loses its preposition. (In other languages, the process might be expressed as converting an original case specification to 'accusative'.)\footnote{There are semantic difficulties in treating subject and object transformationally, in the sense that different choices are often accompanied by semantic differences of one sort or another. These differences are more on the order of 'focusing'—to be as vague as possible—than anything else, and do not seem to require positing 'subjects' and 'objects' in the deep structure. The 'focusing' difference may be extremely slight, as in the pairs (i)-(ii) and (iii)-(iv), or it may have somewhat more 'cognitive content' as in the pairs (v)-(vi) and (vii)-(viii).

(i) Mary has the children with her
(ii) the children are with Mary
(iii) he blamed the accident on John
(iv) he blamed John for the accident
(v) bees are swarming in the garden
(vi) the garden is swarming with bees
(vii) he sprayed paint on the wall
(viii) he sprayed the wall with paint

Sentence (vi) seems to suggest, while (v) does not, that the whole garden has bees in it everywhere; and (viii) suggests, while (vii) does not, that the entire wall got covered with paint.

To the extent that other grammars make use of derived subjects and derived objects—which is the only alternative, within subject/object grammars, to treating verbs like spray, blame, open, break, etc. as involving elaborate and unexplained examples of homonymy—the semantic difficulties are just as great for them as they are for case grammar. Since the 'semantic effect' of the transformations in question is so different in kind from the semantic role of the case relations themselves, and since the latter are not affected by these processes, I am inclined to tolerate the re-introduction into grammatical theory of transformations which have semantic import (of this highly restricted kind).}

Subjectivalization, where it occurs, results in a neutralization of underlying case distinctions to a single form, usually called the
'nominative'. Objectivalization, where it occurs, neutralizes case
distinctions to a single form which, where it is distinct from the
form assigned to subjects, is traditionally termed ' accusative'.
A third process which has the effect of effacing deep-structure
case distinctions is the formation of nominals from sentences. The
case modifications under nominalization transformations usually involve
what is called the 'genitive'.

The brief mention above of situations in which there was an S
embedded to the case category O suggested the ways in which case
grammar must deal with verb and adjective complementation. A
second source of embedded sentences is within the NP itself. The
rule for NP may be stated as (97).

(97) NP → N (S)

Where the N is an ordinary lexical item and the adjunct S contains
a co-referential copy of the same N, the result is a NP consisting of
a noun modified by a relative clause. One of the most obvious sources
of 'genitive' is from relative clauses built on sentences which, by
themselves, would have assumed the form X has Y. The N in the modi-
fied NP is the same as the N contained in the D of the adjunct sen-
tence, and the V is empty. Thus, from (98) we get (99) by deleting
the repeated noun, the tense, and the 'empty' verb, and reattaching
the D to the dominating NP.
A D subjoined to a NP has its case marker modified—in this case to the sibilant suffix. Note (100).

The 'true possessive' construction—resulting either in a NP of the form X's Y or Y of X in English—has as its source a sentence which by itself would have the form X has Y. The fact that in some languages there are instances of adnominal D not modified to the 'genitive' (dem Vater sein Haus, 'Dative of Possession') supports the view that conversion to genitive is a matter of the surface structure.
The treatment of deverbal nouns which seems most satisfactory to me is that, except for the purely productive cases, the derivation of a noun from a verb is a matter of historical not synchronic fact. The synchronic reality is expressed by indicating that a given noun has a particular kind of relationship to a specific verb (or set of verbs), and that some of these nouns may, others must, appear in the NP frame [ ___ S ].

That is, instead of having a synchronic process for producing such words as Latin *amor* from its associated verb, what is needed is the classification of such a word as an abstract noun having a particular kind of relationship with the verb *amo*. 83 Nouns having

---

83 This treatment allows for the inclusion of nouns which lack etymological connections with their related verbs. We might wish to indicate for book a connection of the intended kind with the verb write, thus accounting for the ambiguity of your book between the book which you own (ordinary relative clause modification) and the book which you wrote.

---

this kind of special relationship to specific verbs can take part in a process which introduces into the NP elements which 'originally' depended on the associated verb. The processes in question frequently have the effect of converting the form of the subsidiary NPs to the genitive. 84 Thus the noun *amor* when qualified by a sentence

---

84 Exactly what universal constraints there are, if any, on the element to be converted to genitive is not at all clear. It appears that if there is only one element that shows up in the NP, it frequently takes the genitive form. Compare the ambiguous sentence (i) with sentences (ii) and (iii).

(i) my instructions were impossible to carry out
   (a) so I quit
   (b) so he quit

(ii) my instructions to you are to go there
(iii) *my your instructions are to go there
In English it appears that if the conditions which allow the form of the of-genitive and the s-genitive are satisfied by two different NPs in the associated sentence, multiple genitive constructions become possible, as in the following example borrowed from Jespersen.
(iv) Gainsborough's portrait of the duchess of Devonshire
Japanese allows conversion to genitive in true relative clauses, as well as in the reduced relative clauses. A paraphrase of (v) is (vi); no is the postposition most closely associated with functions which we would call 'genitive'.
(v) boku ga yonda zasshi 'I+subject+read=past+magazine'
"the magazines I read"
(vi) boku no yonda zasshi

of the form deus amat . . . yields amor dei; when qualified by a sentence of the form deum amat . . . the result is again amor dei.
The D and O forms, in other words, are equally reduced to the genitive, resulting when only one noun is involved, in potential ambiguities.  

85 Jespersen's suggestion that the ambiguity of amor dei is in the verb rather than the noun—the noun unambiguously identifying the subject, the verb being ambiguously either active or passive—must be understood as the hypothesis that only those NP constituents which are capable of conversion to surface subjects (with a given verb) may appear under genitive modification as modifiers of the deverbal noun. For English this may well be true. (Jespersen (1924) 170).
4.0. Some remarks on language typology

The view of universal grammar which is emerging is something like this: In their deep structure, the propositional nucleus of sentences in all languages consists of a V and one or more NPs, each having a separate case relationship to the P (and hence to the V). The most straightforward deep structure commonalities between languages are to be sought at this 'deepest' level.

The lexical insertion rule for verbs is sensitive to the particular array of cases in the P. Since no distinction is needed between 'strict subcategorization features' and at least the highest level of 'selectional features' (because redundancy relations exist between cases and some lexical features, and because there is no 'subject' outside of a 'VP' whose features need to be dealt with separately), the lexical insertion rule for verbs can be a strictly local transformation which responds to nothing more than the cases which are co-constituents of V (with the exception, as noted above, that it must be known whether the O element is a NP or a S).

The criteria for typological classification that have suggested themselves so far in this study are these:

I. the presence or absence of modifications on the NPs as determined by the deep case categories
   A. the nature of such modification (prepositional, affixal, etc.)
   B. the conditions for the choice of particular case forms (which, when stated in their simplest form, constitute
what is usually formulated as the 'case system' of the language.

II. the presence or absence of concordial modifications of the verb
   A. the nature of the concord (number agreement, incorporation of 'traces' of case categories, feature changes on V, etc.)
   B. the relation to subject selection (topicalization)

III. the nature of anaphoric processes
   A. type of process (replacement by pro-form, deletion, destressing, replacement by unstressed variants, etc.)
   B. conditions of application

IV. topicalization processes (where 'subject selection' may be thought of as a special case of topicalization)
   A. formal processes (fronting, modifying the case form, etc.)
   B. the variety of topicalization processes in the same language

V. word order possibilities
   A. factors determining 'neutral' word order (nature of case categories, 'ranking' of noun classes, topic selection, etc.)
   B. conditions determining or constraining stylistic variations on word order.

It is important to realize that all of these typological criteria are based on superficial processes, and that there are no particularly good reasons for believing a priori that there will be much coincidence
in the ways in which the different criteria sort out the world's languages.

4.1 The bases for determining case forms

The forms of the NPs in a P are determined on the basis of a variety of factors, one of which is the case category of the NP. Thus a NP under I (i.e., an instrumental noun) is assigned a particular form depending in whole or in part on the fact that it is under I.

Surface case forms of NPs are most elaborately developed in the personal pronouns. The study of the 'case' aspects of pronoun systems reveals a great deal about the variety of relationships that can hold between deep and surface cases.

Sapir's typological distinctions for Amerindian pronominal systems can be expressed in case-grammar terms quite simply.

---

---

If we ignore whatever complications may exist in 'passive' constructions, and if we ignore all deep structure cases except A and O, we can imagine sentences of the following three types given in their underlying propositional form):

(a) V + A intrasitive sentences with active 'subjects'
(b) V + O + A transitive sentences with agents
(c) V + O intrasitive sentences with inactive 'subjects'
Since the V element is constant to the formulas, we can represent these three sentence types by presenting the case frames in three lines, as follows:

(101)  
\[
\begin{array}{c}
A \\
O \\
A \\
O
\end{array}
\]

According to Sapir, then, there are languages which, like Yana, have only one form for pronouns in all four of these positions.

(102).

There are languages like Paiute that have a separate form for the O element in the transitive sentence, all others being the same. The two forms are traditionally called 'nominative' and 'accusative'.

(103)  
\[
\text{accusative} \rightarrow \begin{array}{c}
A \\
O \\
A \\
O
\end{array} \leftarrow \text{nominative}
\]

There are languages like Chinook which give one form to the A of transitive sentences, another to the remaining cases. The terms 'ergative' and 'nominative' are often given to a distinction made in this way.

(104)  
\[
\begin{array}{c}
\text{nominative} \rightarrow \begin{array}{c}
A \\
O \\
A \\
O
\end{array} \leftarrow \text{ergative}
\end{array}
\]
There are languages like Dakota which have separate forms for A and O; here the terms are usually 'active' and 'inactive'.

(105)

inactive →

A

A ←-- active

O

O

And, lastly, there is the situation found in Takelma, which has one form for the pronominal NP of intransitive sentences, and two separate forms for the A and O of transitive sentences. Thus:

(106)

O

O

A

A

What these observations are intended to suggest is merely that if I correctly understand Sapir's analysis of the pronominal systems of these languages, then the case concepts I have been discussing, together with the notion of clause types which various arrays of them define, provide the categorial and configurational information for determining the surface distinctions that are found in these languages.

4.2 Verbal concord

There are these various ways, and possibly more, in which cases and case environments are involved in determining the case
forms of NPs within a P. An additional factor is whether the given NP has been chosen as subject in languages having subject-ivalization processes. Choosing subjects or topics is related to another aspect of the superficial structure of sentences, and that is verbal concord.

The choice of subject in English always has the effect of determining number concord (on those verbal and auxiliary elements capable of reflecting number concord). Apart from number concord, the choice of subject might involve modification of the verb to its passive form, or introduction of the verb have.

The information 'registered' in the V may have only to do with the choice of subject, as in English, or it may be more elaborate. Languages which 'incorporate' pronominal affixes into the V may do so for more than one NP at a time; or noun stems themselves from particular cases may be incorporated into the verbal expression.37

37Grammatical devices for providing concord of this type have been worked out for subject and object incorporated pronominal prefixes in Mohawk by Paul M. Postal. See his "Mohawk prefix generation," PROCEEDINGS OF THE NINTH INTERNATIONAL CONGRESS OF LINGUIST, Mouton (1963), 346-355.

The subject selection rules discussed for English may be compared with the topicalization processes that are described for Philippine languages. The situation for Maranao has recently been described by MacKaugan. One NP is chosen as topic for every sentence, and this choice is recorded in the following way: its original case preposition is replaced by so, and an affix is inserted into the V which indicates the case category of the chosen NP. There is
apparently considerable freedom in the choice of topic. To take the verb meaning 'to butcher' (/sombali/), we find that when the topic noun is an original I, the verb takes on the prefix /i-/ , as shown in (108); and when the topic is an original B, the suffix /-an/ is added to the V, as seen in (109).

(107) somombali ko mama sa karabao
     'The man butchers the carabao'

(108) isombali o mama so gelat ko karabao
     'It is with the knife that the man butchers the carabao'

(109) sombal an o mama so major sa karabao
     'It is for the mayor that the man butchers the carabao' 88

88 Howard McKaughan, "Overt relation markers in Maranao," LANGUAGE, XXXVIII (1962) 47-51. The examples and the description of the relationships are from McKaughan, but a great deal of guessing lies behind my interpretation.

The choice of sentence subjects, or 'topics', from particular cases appears to be the most satisfactory way of accounting for the many types of voice modifications of verbs such as those described as middle, pseudo-reflexive, etc., in the Indo-European languages.

4.3 Anaphoric processes

Anaphoric processes are best understood from the point of view of an extended concept of sentence conjunction. That is, every language has ways of simplifying sentences connected by conjunction or subjunction, and the processes used under these conditions seem to be exactly the same as those used in sentences connected in
discourse. The grammarian's job, therefore, is to describe these
processes as they work in fully independently intelligible
sentences, and then to assume that the utterances that occur in
connected texts or conversations can best be understood from the
point of view of a shared knowledge of the language's anaphoric
processes on the part of speaker and hearer. The fact that in

89 In other words, the grammarian will describe the process by which
(i) in converted to (ii) by noting the conditions under which repeated
elements in conjoined sentences may undergo deletion and pro-replace-
ment and under which conjoined sentences can have words like too and
either added to them.

(i) Mary didn't want any candy and Mary didn't take any
candy
(ii) Mary didn't want any candy and she didn't take any, either

In contexts in which the information contained in the first conjunct
of (i) is already understood by the addressee (by having just been
spoken by him, for example), a speaker of English feels free to use
the reduced form (iii).

(iii) she didn't take any, either
There is no reason, it seems to me, to expect the grammar of a lang-
uage to generate sentences like (iii) directly.

these anaphoric or reduced forms English uses pro-replacement under
conditions that would call for deletion in some other language may
thus be seen as a superficial difference between the two languages.

The point is important—and it was mentioned above in connec-
tion with 'bad' reasons for rejecting the universality of the
subject/predicate division—because the absence of subjects in the
final surface forms of sentences in some languages is seen by many
scholars as having great typological relevance. The optional absence
of NP constituents in languages with person-marker incorporation
(e.g. Chinook) has led scholars to claim that such languages lack
the nexus relations that Europeans understand as 'subject' and 'object'
but have instead what are described as 'appositional' relations between NPs and Vs. See, e.g., the statement in Alf Sommerfelt, "Sur la notion du sujet en géorgien," MELANGES DE LINGUISTIQUE ET DE PHILOGIE OFFERTS A JACQUES VAN GINNEKEN, Paris (1937) 183-185.

A distinction is made by some scholars between true subject/predicate languages and those in which the so-called 'subject' is as much a 'complement' to the V as is the direct object or any of the various adverbial elements. To Martinet, a subject is different from a complement only if it is "constitutive of the minimal utterance"—that is, only if it is obligatorily present in both full and anaphorically reduced utterances. In Japanese, the 'minimal utterance' lacks a subject, and hence, the argument goes, Japanese sentences lack the subject/predicate structure of sentences in our more familiar languages. To Martinet's disciple Saint-Jacques, this typological 'fact' about Japanese is regarded as excessively important. It is only by dint of considerable intellectual effort that the Westerner can achieve that liberation from familiar ways of thinking about language which is required for an understanding of the true character of Japanese. Or so Saint-Jacques tells us. It seems to me that

language typology offers enough genuine excitements to make it possible for us to give this one up. The intellectual achievement of which M. Saint-Jacques speaks is that of knowing that when there is an 'understood' NP to deal with, some people replace it by a pronoun, others get rid of it.

4.4 Topicalization

The fourth criterion has to do with topicalization processes, devices for isolating one constituent of a sentence as 'topic', of bringing one particular constituent of a sentence into some kind of 'focus'. Where topicalization is distinct from processes for 'emphasizing' a constituent, we have much the same thing as what I have been calling 'subjectivalization', but which I shall now begin calling 'primary topicalization'. Primary topicalization for English involves position and number concord; stylistic changes involving stress assignment, late word order changes, and possibly the 'cleft-sentence construction', fall into what might be called 'secondary topicalization'. From what I understand of McKaughan's account, primary topicalization in Maranao involves replacement of the original preposition associated with a noun by so and introduction into the V of an associated case indicator, while secondary topicalization involves moving an NP to which so has been added to the front of the sentence.93 One might refer to Oertel's study of the disjunct use of cases in Brahmanic prose as a study of secondary topicalization.94
Hanns Oertel, THE SYNTAX OF CASES IN THE NARRATIVE AND DESCRIPTIVE PROSE OF THE BRAHMĀNAS, Heidelberg (1936) pp. 364. Oertel distinguishes 'pendent' uses of a 'disjunct case, where the 'topic' is in the 'nominative' even if its original role in the sentence was not that of subject (comparable, I assume, to he in he, I like him), and 'proleptic' uses, where the topic retains the original case form, is moved to the front of the sentence, and may or may not be resumed (in the form of a demonstrative) in the remainder of the sentence (comparable to him in him, I like (him)).

I would imagine that all languages possess some means of carrying out 'secondary topicalization', but it may be the case that some lack the process of 'primary topicalization' ('subjectivalization').

Jeffrey Gruber's recent study of topicalization in child language suggests that ontogenetically, motivated (what I am calling 'secondary') topicalization precedes the use of formal subjects in English. It may be that when one device for topicalization becomes 'habitual', it freezes into a formal requirement and the language must then call on other processes for motivated topicalization. (See Jeffrey Gruber, "Topicalization in child language," FOUNDATIONS OF LANGUAGE, III (1967).) Kenneth Hale reports that for Walbiri, an 'ergative' language of aboriginal Australia, there is apparently no 'subjectivalization' process, but any constituent may be repeated to the right of the proposition, the element inside the proposition being replaced by a pro-form. (Correspondence, 1967).

The notion 'subjectivalization' is useful only if there are sentences in a language which offer a choice of subject. Languages described as not having passives, or languages described as only capable of expressing transitive sentences passively, apparently lack the grammatical process of primary topicalization.

This question leads naturally to the problem of the so-called 'ergative' languages. Recall that in the accusative type of pronominal system, the pattern was
and that the ergative type was

Now when languages of the accusative type have passive versions of sentences whose propositional form is \([V O A]\), the case forms associated with the elements in the passive version are generally 'nominative' for the \(O\) and 'agentive' (realized as ablative, instrumental, or what have you, depending on the language) for the \(A\). If passive sentences were introduced into our three-line diagrams and their active counterparts removed, we would get the pattern

\[
\text{nominative} \rightarrow \begin{array}{c}
\text{A} \\
O \\
\end{array} \quad \text{agentive}
\]

which is exactly like that for the regular assignment of cases in the ergative languages. This fact, plus the use of the term 'nominative' for subject-of-intransitive-cum-object-of-transitive in these languages, has led many scholars to identify the ergative case in ergative languages with the agentive case form found in passive sentences in accusative languages, and to conclude that the ergative languages are really 'passive' languages, languages in which transitive sentences can only be expressed passively.\(^96\) For both of
Note that even if there is a different form for the verb in \([__0\) and \([__0+A\) case frames, this cannot be interpreted as evidence of 'passivity'. As mentioned earlier, in languages not of the ergative type there may still be systematic variation of the same verb root depending on whether it is used transitively or intransitively.

these systems, the case that has been given the name 'nominative' is frequently described as the 'subject' in a subject/predicate construction, and the 'ergative' element in the one instance and the 'accusative' element in the other are treated as verbal complements.  

See, e.g., the statement in Nikolai S. Trubetzkoy, "Le rapport entre le déterminé, le déterminant et le défini," MELANGES DE LINGUISTIQUE, OFFERTS A CHARLES BALLY, Geneva (1939) 75-82.

The difficulty of determining the 'subject' in ergative languages has been described by Martinet. Some scholars identify as subject the word which would be the subject in a translation of the sentence into French-- i.e., the nominative in intransitive sentences and the ergative in transitive sentences. Others regard the nominative as the subject in all sentences, thus giving transitive sentences a 'passive' interpretation. Lafon gives up on transitive sentences-- he uses the term 'subject' only for intransitive sentences, saying of transitive sentences that they have no subject.  

Vaillant, on the other hand, spoke of the northern Caucasian languages as having three types of verbs (i) true intransitives,
with subjects in the 'nominative'; (ii) 'operative pseudo-transitives', with 'pseudo-subject' in the 'ergative'; and (iii) 'affective pseudo-transitives', with 'pseudo-subjects' in the 'dative'. It seems quite clear that what he is dealing with are

sentences having Ps of the three types [V O], [V O A] and [V O D], where the surface cases for O, A and D are 'nominative', 'ergative' and 'dative' respectively. It looks very much as-if that is all there is to say. For my part I would much rather say of the ergative languages that they lack subjectivalization, that all transitive sentences undergo obligatory passivization, or that some of their sentences contain true subjects while others do not.

It is very frequently claimed that the ergative languages are more primitive than the accusative languages, and with the

assumption that the ergative construction is really a passive construction, this has led such scholars as Kuryłowicz, Schuchardt, and Uhlenbeck, to assume that the passive construction represents a more primitive concept in the evolution of language than that of the active transitive construction. Evidence musterred for this position includes the signs that pre-Indo-European was of the ergative type, and the fact that some languages have 'invented' have-like verbs in relative recent times. The invention of have made it possible to give active expression to certain tense or aspektual forms which had
remained unaffected by the general change from passive to active expression (as is seen, for example, in the c. 3rd century shift from expressions of the type *inimicus mihi occissus est* and *mihi illud factum est* to transitive expressions using *habeo: inimicum occisum habeo* and *habeo illud factum.*

It seems very unlikely to me that syntactic changes of the type known from the present state of our knowledge are really capable of showing an intellectual evolution of a type as potentially significant as whatever might be understood as the transition from an essentially passive to an essentially active point of view. The connection claimed by van Ginneken between ergativity and the 'feminine' character of the cultures that have ergative languages is one which also deserves to be brought into question.

102 The following seems worth quoting in full: "Nous sommes tous des hommes, et tous nous avons deux talents: les facultés plus actives de l'appétit et de la volonté, et les facultés plus passives des sensations et de l'appréhension; mais il est évident que les deux sexes de l'humanité montrent sous ce rapport une différence sensible. "L'ethnologie moderne, qui a écarté définitivement comme insuffisante la doctrine du développement uniforme, nous apprend cependant que le progrès de l'humanité a balancé presque toujours entre les cultures plus féminines ou plus masculines, dites cultures matriarcales et patriarcales. Ce sont toujours les cultures matriarcales très prononcées qui, comme le basque, ont un verbe transitif de nature passive avec comme casus rectus un patient et comme casus obliques un agent; mais les cultures patriarcales, comme l'indo-européenne ont un verbe transitif de nature active, animiste et magique, avec un sujet au casus rectus et un object au casus obliques. Chaque peuple a donc le verbe qu'il mérite." (van Ginneken (1939) 91f)
4.5 Word order differences

The fifth criterion suggested for a language typology is that of word order. The variables that determine or constrain the freedom of word order in the languages of the world are very likely to have many important connections with the case structure of sentences; but this is an area which I have not examined at all.
5. The grammar of inalienable possession

The preceding sections have amounted to an informal description of a syntactic model for language and a few demonstrations of the operations of the model of the sort that has come to be called 'restatement linguistics'. In the present section I shall attempt to show how a particular substantive modification of the rules will permit a uniform way of describing the interesting collection of grammatical facts associated with what is called 'inalienable possession'.

Every language, one can be sure, has nouns which express concepts that are inherently relational. Examples of inherently relational nouns in English are side, daughter and face. One doesn't speak of a side, but of a side of something; one doesn't say of someone that she is a daughter, only that she is somebody's daughter; and although it is possible of speak of having seen a face, the word is typically used when referring to 'his face' or 'your face' or the like. The relational nouns most frequently discussed in the linguistic literature are names of body parts and names of kinsmen. My discussion here will concentrate on body parts.

5.1 The data

5.1.1 Significant syntactic relationships exist between the dative and the genitive cases in all of the Indo-European languages; and in all but Armenian, according to Havers, the dative
and the genitive case forms figure in paraphrase relationships of kinds that are highly comparable from language to language. ¹⁰³

¹⁰³Wilhelm Havers, UNTERSUCHUNGEN ZUR KASUSSYNTAX DER INDOGERMANISCHEN SPRACHEN, Strassbourg (1911) Pp. 335; 317.

The relationship is observed only when the associated noun is of a particular type. To take some of the modern German examples given by Havers, we observe that a paraphrase relation exists between (111) and (112) as well as between (113) and (114); but that of the two sentences (115) and (116), the latter is ungrammatical (as a paraphrase of (115)).

(111) die Kugel durchbohrte dem Feind das Herz
(112) die Kugel durchbohrte das Herz des Feindes
(113) er hat mir die Hand verwundet
(114) er hat meine Hand verwundet
(115) der Vater baute seinem Sohn ein Haus
(116) *der Vater baute ein Haus seines Sohnes

It should be noted that Herz and Hand are the names of body parts, while Haus is not.

5.1.2 There are cases like the above where a given language exhibits in itself the paraphrase relationship, and there are also cases where it appears that one language has chosen the dative expression, another the genitive. Notice the following sentences, also from Havers.

(117) my heart aches; mir blutet das Herz
(118) Tom's cheeks burned; Tom brannten die Wangen
(119) she fell on her mother's neck; sie fiel ihrer Mutter um den Hals

5.1.3 There are adnominal (possessive) uses of dative constructions, particular, it appears, when the possessive pronoun is also used with the possessed element. Here the most readily available examples are with kinship terms.

(120) dem Kerl seine Mutter
(121) sa mère à lui

Examples are from Havers (1911) 283

5.1.4 Many languages have separate possessive affixes for nouns that are obligatorily possessed (inalienables) and nouns that are optionally possessed (alienables). The difference in Fijian is apparently expressed by pre-posing the possessive morpheme to indicate alienable possession, suffixing it to indicate inalienable possession. Since the category 'inalienable' is a category of grammar rather than a property of real world objects (since, in other words, some objects grammatically classed as inalienable can in fact be separated from their 'owners'), the distinction can be seen most clearly if both methods of expression can be used with the same noun stem. Lévy-Bruhl gives a persuasive example of this situation: Fijian uluqu means the head which is
now firmly attached to my neck, while kequ ulu, also translatable as 'my head', would refer to the head which, say, I am about to eat.\textsuperscript{106}

\textsuperscript{106}L. Lévy-Bruhl, "L'expression de la possession dans les langues mélanésiennes," BULLETIN DE LA SOCIÉTÉ LINGUISTIQUE DE PARIS, XIX (1916) 96-104; 99.

Languages may have separate morphemes for indicating alienable and inalienable possession, and they may have further distinctions among these morphemes depending on the type of inalienable possession (as Nootka, for example, suffixes -\textsuperscript{2at}- to nouns representing physically inseparable entities, e.g. body parts, but uses other means for kinship terms), or they may merely have a class of nouns incapable of occurring as free forms--noun stems requiring affixation of possession indicators.\textsuperscript{107}

\textsuperscript{107}This last situation is sometimes described by saying that nouns are 'inflected for person'. See Gabriel Manessy, "La relation génitve dans quelques langues mandé," PROCEEDINGS OF THE NINTH INTERNATIONAL CONGRESS OF LINGUISTS, Mouton (1964) 467-475; 468.

In all of these cases, it appears, the features in question are 'grammatical' rather than purely 'notional'. Discussions of inalienable possession almost always contain lists of nouns whose grammatical classification is the opposite to what one would notionally expect. Lévy-Bruhl mentions a case where the
worf for 'left hand' functions as a body-part word grammatically, but the word for 'hand' does not.\textsuperscript{108} And Arapaho classifies 'louse' (or 'flea') among the inalienables,\textsuperscript{109} a situation that invites people who like to speculate on these things to propose something or other on the Arapaho conception of 'self'.

5.1.5 Milka Ivić has recently discussed many instances of what she calls 'non-omissible determiners'. Among the examples she cites are many that involve nouns of the type frequently included among the inalienables. The adjective cannot be deleted, for example, in the Serbo-Croatian expression (122), for (123) is ungrammatical.\textsuperscript{110}

\textsuperscript{108} Lévy-Bruhl (1915) 96.

\textsuperscript{110} Milka Ivić, "The grammatical category of non-omissible determiners," LINGUA, XI (1962); and "Non-omissible determiners in Slavic languages," PROCEEDINGS OF THE NINTH INTERNATIONAL CONGRESS OF LINGUISTS, Mouton (1964) 476-479; the example is from p. 477.

(122) devojka crnih očiju "the girl with black eyes"

(123) devojka očiju

What is misleading about her discussion, it seems to me, is the decision to associate with the adjective the 'category of non-omissibility'. It is as if we wished to say, for the English sentence (124), that there is something grammatically significant
about the word missing, since its deletion results in a sentence (125) which is somewhat different in type from the original; put differently, sentence (124) does not say the same thing that (126) does. What is genuinely important about (124) is its paraphrasability as (127) (or (128)) and the fact that the construction exhibited by (124) is restricted to certain kinds of nouns. Note the ungrammaticality of (129):

(124) I have a missing tooth
(125) I have a tooth
(126) I have a tooth and it is missing
(127) my tooth is missing
(128) one of my teeth is missing
(129) *I have a missing five-dollar bill

5.1.6 Note that in sentences (124) and (127), three things are involved: (a) a Possessor (an 'Interested Person', to use the traditional term), (b) a Body Part, and (c) an Attribute—(a) me, (b) tooth, and (c) missing respectively—and that the sentences provide alternate ways of ascribing the Attribute to the Possessor's Body Part. They are two distinct superficial ways of expressing the same relationship among these three concepts.

Using P, B and A for (a), (b) and (c) above, we may represent the expression as seen in (124) as (130) and that as seen in (127) as (131).

(130) \( P^{\text{Nom}} \text{ have} [A \to B^{\text{acc}}] \)
(131) \( [p^{\text{gen}} \to B] \text{ be } A \)
The same element, in other words, which in some of the paraphrases mentioned above appeared in either the dative or the genitive case forms, is now also seen appearing as the subject of the verb have. Bally, in fact, speaks of the invention of the word have as having precisely the function of allowing the 'personne intéressée', which otherwise would have to appear either in dative or genitive form, to become the subject of a sentence. Examples of all three surface appearances of a first person Possessor are given by Bally as (132)-(134). (133) and (134) correspond to expression types (130) and (131) respectively; the expression type exemplified by (132) is given as (135).

(132) mihi sunt capilli nigri
(133) j'ai les cheveux noirs
(134) mes cheveux sont noirs

(135) P^dat [B^nom be A]

---

111 Charles Bally, "L'expression des idées de sphère personnelle et de solidarité dans les langues indo-européennes," FESTSCHRIFT LOUIS GAUCHAT, Aarau (1926) 68-78; 75.

5.1.7 Henri Frei surveyed this variety of surface representations of the 'same' sentences, and added a fourth type, a type intermediate, in a sentence, between that suggested by formula (135) and that of (130). His example was sentence (136) (which also provided the title of his paper), which exemplifies the expression type we may wish to represent as (137).

(136) Sylvie est jolie des yeux
(137) P^nom be [A ^oblique].
Frei points out that the construction seen in (136) is related to the category of inalienable possession, since while (138)-(139) are acceptable sentences, (140)-(141) are not.

(138) elle est fine de doigts
(139) elle est bien faite des jambes
(140) *elle est fine d’étoffe
(141) *elle est bien faite des vêtements

112 Henri Frei, "Sylvie est jolie des yeux," MÉLANGES DE LINGUISTIQUE OFFERTS A CHARLES BALLY, Geneva (1939) 185-192; 188. The expressions are limited to clear relational nouns, not only to body parts. Frei notes such phrases as "des couloirs spacieux et bas de plafond" and "libre de moeurs." He beautifully demonstrates the distinctness of the sentences involving inalienable possession from overtly similar sentences of different grammatical structures with the contrast between (i) and (ii) below. (p. 186)

(i) la salle est pleine de visages
(ii) la femme est pleine de visage

5.1.8 'Since Frei sees this diversity as resulting from the attempt to 'condense' two judgments into one sentence—the two judgements that P has B and that B is A (in our terms)—he relates the constructions in question to the much-discussed 'double-subject' constructions of Japanese. In one type of this latter construction, two nouns appear before a verb or adjective, the first followed by the particle wa (indicating what I have called 'secondary topicalization'), the second by the particle ga (the particle of 'primary topicalization'). (Variations on the order and in the choice of particles do not change the status of the construction; the form described is the one most stylistically neutral.) The second of these nouns is of the inalienable
type, the first identifies the object with respect to which the object identified by the second noun is 'inalienable'. The hackneyed example of the double-subject construction is item (142), a sentence which has (143) as a sort of forced paraphrase. In (143), the particle no is the particle whose functions are closest to those we would be inclined to label 'genitive'.

(142) zoo wa hana ga nagai "elephant wa nose ga long"
(143) zoo no hana ga nagai.

5.1.9 That expressions involving entities viewed as being closely associated with an 'interested person' have unique grammatical properties has also been observed in certain semantically unmotivated uses of 'reflexive pronouns' and the parallels one finds between these and various uses of the 'middle voice'. The connection with dative forms is seen in the fact that in some languages a kind of 'dative reflexive' is used in these special situations. Note items (144) and (145).

(144) se laver les mains
(145) ich wasche mir die Hände

The connection between this use of the 'reflexive' and the category of inalienable possession is indicated by Balły where he points out that in item (146), jambe is the inalienable entity, while in (147) the word jambe can only (or, depending on my informants, can also) be understood as some independently possessed object, such as the leg of a table.

(146) je me suis cassé la jambe
(147) j'ai cassé ma jambe

Notice that the jambe which does not have the possessive adjective
is the one which is grammatically characterized as 'obligatorily possessed'!\textsuperscript{113}

\textsuperscript{113}Bally (1936) 68f.

5.2 Adnominal datives

One way of introducing a possessive modifier of a noun has already been suggested: a sentence which could on its own assume the form \textit{X has Y} is embedded to NP. Since it is desirable for an embedded sentence to have a semantic interpretation that contributes to the meaning of the whole sentence, the sentence-embedding source of possessives is needed as an explanation for alienable possession. In other words, one is satisfied to have the meaning of (148) represented as a part of the meaning of (149), though we may reject such a relationship between (150) and (151).

(148) I have a dog
(149) my dog
(150) I have a head
(151) my head

A distinct method is required for introducing the possessive element in the case of inalienable possession, a method which reflects the fact that the relationship between the two nouns in 'inalienable possession' is not (\textit{pace} Frei) a sentential relationship.
For the types of inalienable possession that we have considered so far—in which the relationship has always been to an animate or 'personal' entity—the solution is to say that some nouns obligatorily take D complements. This can be managed by adding to the grammar another way of writing NP, namely rule (152).

(152) NP \rightarrow N (D)

In the way that frame-features for Vs relate to environments of Vs provided by the constituent P, frame-features for Ns relate to environments provided by the constituent NP. It was suggested above that Ns which obligatorily take S complements are assigned the feature \(+[\_\_ S]\). We may now add that Ns which obligatorily take D complements are characterized as having the feature \(+[\_\_ D]\); and these are the inalienably possessed nouns. The notation imposes a subclassification of nouns into those which require adnominal D (such as son, child in the meaning 'offspring', German Mann in the meaning 'husband') and those which reject adnominal D (such as person, child in the meaning 'very young person', Mann in the meaning 'man').

The two sources of possessive modifiers which the grammar now makes possible (adnominal D and adnominal S of a certain type) provide the deep-structure differences needed for determining the difference in the form of the possessive modifiers in those languages which make the distinction overt in that way. Where further distinctions are made (as between body parts and kinship terms), the information on which such distinctions need to be based may be included as lexical features of the Ns themselves.
The general configuration of NPs containing Ds, then, is that shown in (153).

\[(153)\]
\[
\begin{array}{c}
\text{NP} \\
\text{N} \\
\text{D} \\
\text{K} \\
\text{NP} \\
\text{N}
\end{array}
\]

In some cases the adnominal D remains in the NP and in fact retains the surface features associated with D, as in item (154); typically, however, a D inside a NP is changed to a genitive form, as in (155).

\[(154)\text{ secretary to the president}\]

\[(155)\text{ the president's secretary}\]

If determiners are universal,\textsuperscript{114} then the expansion of NP

\textsuperscript{114}I am inclined to think that they are. See my "The syntax of English preverbs," to appear in GLOSSA, II (1967).

must make provisions for them; but if they are not, then those languages which have them will need 'segmentalization' rules of the type described by Postal\textsuperscript{115}. At any rate, the determiners (which

\textsuperscript{115}Paul M. Postal, "On so-called 'pronouns' in English," GEORGETOWN UNIVERSITY MONOGRAPH NO. 19, LANGUAGES AND LINGUISTICS (1966), 177-206.

I represent as 'd') will figure in the various things that can happen to adnominal D. Sometimes, for example, when a D remains in the NP without undergoing genitive modification, certain of its features are copied onto the determiner so that the determiner
may eventually assume the form of the appropriate 'possessive adjective'. This seems to account for such expressions as the possessive dative with kinship terms seen in some German dialects (recall example (120)) in Ossetic, etc.

5.3. Some illustrations

The D constituent often need not remain the NP: under some conditions it may be 'promoted', so to speak, from the status of a modifier of a N (which it is in the deep structure) to the status of a major constituent on the next higher level of the syntactic structure. This can be seen in sentences having the base configuration [ V + L + A ]; just in case the N under L is a body part, the D which in the deep structure is subjoined to L is 'promoted' to become a constituent of P, yielding a sentence superficially of the type [V + D + L + A].

The verb pinch is accepted into the case frame [ ___ L + A], and, except when it has taken on the feature [+Passive], it is a verb which deletes the preposition of the following constituent. Let us consider sentences derivable from the deep structure seen in (156).
We shall see what happens to the sentence under four conditions: when the D remains inside L and A becomes the subject; when the D remains inside L and L becomes the subject; when the D is promoted and A becomes the subject; and when the D is promoted and D becomes the subject.

Whenever D remains inside NP (in this sentence), it is proposed to the N and converted to its genitive form, displacing the original determiner. Since it is a personal noun, the K element assumes the form of a genitive suffix. With non-promoted D, in other words, (156) eventually becomes (157).
Diagrams (158) - (161) show the development from (157) when A is made the subject: the subject-preposition is deleted and its case category is erased; the preposition after pinch is deleted and the case category L is erased; and the tense is absorbed into the V.
If the L of (157) is chosen as subject instead of the A, the result is (162). This choice of subject requires the V to assume the feature [+Passive], which causes it to lose its ability to delete following prepositions and its ability to take tense affixes. The surface structure eventually resulting from (162) is (163).
Backing up to (156), we may now see the consequences of 'promoting' adnominal D. When the D is removed from L and becomes the left-most case constituent in P, the resulting structure is (164).

The possible subjects for (164) are the A or the newly promoted D. When the subject is A, we get (165), a structure which, on application of the rules we have learned, eventually becomes (166).
When D is made subject, on the other hand, we get (167); on applying the rules appropriate to a V with the feature [+Passive], we eventually get (168).

(167)

(168)

We may turn to the problem which interested Bally and Frei and examine the role of adnominal D in sentences which assign attributes to obligatorily possessed elements. The basic structure of such sentences can be illustrated by item (169).
In languages which allow the $D$ to remain in the $NP$, the $D$ element is converted to its genitive form. In English this results in (170). Since (170) has only the form $[V + O]$, the $O$ is necessarily chosen as subject; the result for English is item (171).
Notice that since the V is an adjective, it is incapable of 'absorbing' the tense\(^{117}\), requiring the provision of be within the M constituent. (171) is a rendering of (170) in which the V is predicated on the O and the D is subjoined to the O. Thus it is analogous to our earlier sentences (127) and (134) and is of the type indicated in (131).

Suppose next that the D of (170) does get 'promoted'. The result of introducing the D in this way as an immediate constituent of the P is item (172).

\(^{117}\)Stated more accurately, Vs which are adjectives, passives or progressives are incapable of absorbing the rightmost affix in M.
Some languages allow the O of configuration (172) to become the subject, with the D element remaining in the expected surface form for D, as in sentence (132). Others allow the D element to undergo secondary topicalization when the O is subject, resulting, for example, in one case of the 'double-subject' construction in Japanese (recall (142)). The general expression type for sentences resulting from (172) when O becomes subject is suggested by formula (135) above.

Many languages allow the D to become subject. When this happens and there are no other changes, the O appears in some oblique case-form. This is so because, since beautiful is not a true verb, the body-part word cannot be converted into an 'object'. The initial structure is seen in (173); it is one which is not typical of English, though it is perhaps seen in such expressions as those given in (174) and it may represent a stage in the derivation of phrase of the type given in (175).

\[(173)\]

\[\begin{array}{c}
    \text{S} \\
    \text{NP} \\
    \text{d} \quad \text{N} \\
    \text{the girl}
\end{array}\]

\[\begin{array}{c}
    \text{M} \\
    \text{V} \\
    \text{pres beautiful } \emptyset
\end{array}\]

\[\begin{array}{c}
    \text{O} \\
    \text{K} \\
    \text{NP} \\
    \text{eyes}
\end{array}\]

\[(174)\) tall of stature; blue in the face; etc.

\[(175)\) broad-chested; fat-legged; etc.
It appears to be the structural form underlying (136), whose expression type is given in formula (137). The construction is apparently quite rare in French; Frei speaks of it as a 'short-circuited' version of the sentences with have.

Another possibility, when D is subject, is to attach the adjective to the NP indicating the body-part. I propose, in an unhappily quite ad hoc fashion, that this be done without removing the constituent label V. I believe there are some arguments for retaining at least an abstract V under P at all times, so this constraint may turn out to be better motivated than it seems. The reason for this decision is that this appears to reflect what actually happened in those languages which adopted a verb like have.

The structure I have in mind is that shown in (176).

(176)

```
S
  /\  
NP  M
  /\  /\  
  d  N  V  P
     \  \  
      K  O
      /  /
     V  NP
    /   |
   N    N
  the   beautiful
    pres  eyes
```

With the V under P vacant, the M must have a be added to it in those languages which allow structures of this type to become sentences directly. Notice that in this construction the modified body-part NP as a whole is 'in' some case form. The formula for this expression type has not yet been given; it would be something
like (177).

(177) P be [A-B]oblique

Conceivably this is the structure underlying such predicates as those shown in (178); the difference between predicates of the type (137) and those of the type (177) is seen in the Latin paraphrases (179) and (180) respectively.

(178) of tall stature; di bello aspetto

(179) aequus animo

(180) aequo animo

The last possibility, then, is to insert into the vacated V position the function word have, a verb which takes the modified body-part noun as its 'object'. In English, we have seen, this involves deleting the preposition. The result of modifying (176) in this way is (181).

(181)

In short, it appears that the considerable surface variety found in sentences involving attribution of some property to an inalienable noun is to be accounted for by positing for universal grammar, in the spirit of Bach (1965), a set of recurrent transformations which each language uses somewhat in its own way. For
sentences of the general structural type (182)

(182) $P[V^O[D+N]]$

where $V$ is an adjective and $N$ is a body-part noun, the options are (a) - (d) below:

(a) PROMOTE D
(b) CHOOSE D AS SUBJECT
(c) COPY ADJECTIVE INTO BODY-PART NP
(d) INSERT HAVE INTO THE VACATED V

When (a) is not applied, the D becomes a genitive modifier of the body-part $N$ and the whole $O$ becomes the subject. When (b) is not applied, the $O$ becomes the subject. When (c) is not applied, the 'short-circuited' sentences of Frei are the result. Rule (d) is available only to those languages which have 'invented' have.

5.4 Further remarks on inalienable possession

If the feature of inalienable possession is to be treated as a universal property of language, then either vocabulary items which are translations of each other will be categorized alike with respect to alienability, or the ways in which languages separately classify the 'same' things may possibly reflect differences in the psychic make-up of the speakers of different languages. Many scholars have seen in the data on inalienabilia an opportunity for the science of language to shed light on primitive mentality and on the possible range of man's concept of 'self'. Since the differences appear more and more to be differences on the level of surface structure, it may be advisable to wait some
time before reaching any conclusions on these matters.\footnote{For representative statements on the sociological relevance of the study of inalienable possession, see Lévy-Bruhl (1916) 103; Bally (1926) 68 \textit{et passim}; Frei (1939) 192; and van Ginneken (1939) 90. For a catalogue of noun classifications based on grammatical differences associated with inalienable possession, see Haaim Rosén, "Die Ausdrucksform für 'veräusserrlichen' und 'unveräusserrlichen' Besitz im Frühgriechischen," \textit{LINGUA}, VIII (1959) 264-293; 268f.}

Adnominal D will certainly be needed for more than body-part nouns and names of relatives. Directional indicators like \textit{right} and \textit{left} are probably nouns of this type too. The reason that these words appear typically without any personal reference in English and many other languages is that they frequently refer to position or direction with respect to the speaker or addressee of the utterance, and there are simply many situations in which an adnominal D does not need to be expressed if it identifies speaker or hearer.

There are, too, many relational nouns which do not have a specifically personal reference. We might wish to say that certain 'locational' nouns take an adnominal L. These nouns sometimes name parts of the associated objects, as in (183), and they sometimes identify a location or direction stated with reference to the associated object but not considered as a part of it, as seen in (184). 'Nouns' of the second type appear superficially as prepositions in English.

(183) corner of the table, edge of the cliff, top of the box

(184) behind the house, ahead of the car, next to the tower
6. Problems and suggestions

There is a considerable residue of unsolved problems in the grammatical description of language phenomena, and it is disappointing though not surprising to realize how many of them remain unsolved under the formulation of grammar I have been suggesting. Those which come most quickly to mind are coordinate conjunction, nominal predicates, and 'cognate objects'.

6.1 Coordinate conjunction

There may be a relationship between the ways in which languages deal with 'comitative' constructions and the phenomenon of coordinate conjunction of NPs. Put in case terms, there may be a relationship between conjunction of NPs and what one might wish to refer to as a Comitative case. Jespersen noticed the parallels between with (a preposition which has a Comitative function) and the conjuncor and, as in such pairs of sentences as (185) and (186).

(185) he and his wife are coming
(186) he is coming with his wife

\[119\] Jespersen (1924) 90

Japanese has separate devices for indicating sentence conjunction and NP-conjunction, and the postposition used for NP-conjunction
is identical with the Comitative postposition. In a conjunction of NPs, all but the last have the postposition to. The last one has the postposition appropriate for the case role of the whole NP. Compare (187) and (188).

(187) Tanaka-san to Hashimoto-san ga kimashita
     "Mr. Tanaka and Mr. Hashimoto came"

(188) Hashimoto-san ga Tanaka-san to hanashimashita
     "Mr. Hashimoto spoke with Mr. Tanaka"

Redden points out that in Walapai a sentence has only one noun in the 'nominative' case. Noun conjunctions are effected by having the 'ablative' suffix—the suffix with Comitative function—on all but one of the nouns in a conjunction. Thus, in (189), /-č/ is nominative, /-m/ ablative.

(189) /hátéáú̯č hmánm/
     "the dog and the boy" (lit. "the dog with the boy")

It may be that rule (190) is needed as an expansion rule for NP.

(190) NP \implies NP + C

Using X as a cover term for the various case categories, (190) will produce such structures as (191).
The case category C has a very special status, since the selectional constraints on nouns under C are those of the superordinate C. What is needed, in other words, is a rule which imposes on any N under C the same redundant features that are associated with the dominating non-C case.

A subjoined C under some circumstances must remain in the large NP. In languages which lack a generalized conjunctor, the case marker is simply that appropriate to C (the postposition to in Japanese, the suffix -m in Walapai); in languages which have a generalized conjunctor, it replaces the case marker, in the way that and replaces with under certain conditions.

The structure underlying (185) and (186), then, might be something like (192); we ignore the source of his.

(192)

If the C remains inside the NP, the entire A becomes the subject, yielding sentence (185); if the C is promoted, however, as in
the structure shown in (193), it is left behind when the A
becomes the subject, resulting in sentence (186).

(193)

```
M
\[ S \]
\[ P \]
\[ V +Prog \]
\[ K \]
\[ N \]
\[ d \]
\[ N \]
```

It is quite unlikely that the numerous problems associated
with NP conjunction can be appreciably simplified through this
approach, but that there is some connection between conjunction
and comitative uses of NPs cannot be doubted. Lakoff and Peters
have recently presented very persuasive arguments that the
'direction' of the relationship is the opposite of what I have
suggested; that, in other words, Comitative phrases are derived
from NP conjunction rather than the other way around.\textsuperscript{120}

\textsuperscript{120}George Lakoff and Stanley Peters, "Phrasal Conjunction and
Symmetric Predicates," HARVARD COMPUTATION LABORATORY REPORT
NO. NSF #17 (1966) VI-1 - VI-49.

6.2 Nominal Predicates

Nothing that has been said so far suggests a way of providing
for sentences of the \textit{N be N} type. It is clear that they represent
a distinct sentence type from those involving any of the case relations discussed above, though there may be more than one case relationship involved in these sentences. (The terms Essive and Translative come to mind.)

There are some nouns that appear in predicate position but which are restricted in their occurrence elsewhere. It might be possible to treat these nouns as, on one level, Vs which are restricted to the form [ ____ A]. Examples are words like idiot, bastard and fool. The environment contains A because the subject is always animate and because the constructions exhibit selectional and transformational properties associated with Vs having As in their environment. Notice items (194) and (195).

(194) don't be a fool
(195) he's being a bastard again

This interpretation appears to account for the fact that we have sentences like (196), but not—with idiot used in this same 'evaluative' sense—(197).

(196) John is an idiot
(197) an idiot hit the first homerun

Further evidence that the word is properly treated as a V is found in the fact that these nouns may accept types of modification usually associated with adjectives, as in (198).

(198) John is quite an idiot

The serious problems are (a) with the use of words like idiot, fool, etc., in other contexts, as in (199), and (b) with
the use of non-evaluative Ns in predicate sentence, as in (200).

(199) that rat swiped my lunch
(200) that boy is my nephew

A new case category or two could be invented for the occasion, of course, but such matters as the number agreement requirement between subject and predicate NPs remain as serious as they ever were. Perhaps some solution is forthcoming along the lines of Prof. Bach's proposals elsewhere in this volume.

6.3 Cognate objects

A difficulty of another sort is presented by the so-called 'cognate-object' constructions. These are constructions in which, at the very least, there is a high selectivity between a specific V and an 'object' N, and in which the V+N combination in one language might well be matched by a V alone in another language.

Slightly modifying a recent analysis by Sandra Babcock, 121, I would propose that there are contexts in which the case category F (Factive) may be left lexically empty, and that certain words classified as Vs may be inserted specifically into frames containing dummy Fs. These words may have associated with them

121 Sandra S. Babcock, "Syntactic dissimilation" (1966) unpublished paper; compare too the interpretation in terms of 'quasi-transformations' found in Zellig Harris, "Co-occurrence and transformation in linguistic structure," LANGUAGE, XXXIII (1957) 283-240, Sec. 30.
special N representatives (like, e.g., bath) and special pro-Vs (like, e.g., take). The rules that apply to dummy-F sentences are the following:

(a) COPY THE N-REPRESENTATIVE OF THE V UNDER THE F
(b) REPLACE THE V BY THE DESIGNATED PRO-V

The rules may have separate conditions of optionality for different Vs. The cognate-object V dream may appear as a V in its own right, or it may appear in dummy-F sentences. As a cognate-object verb, it has dream as its N-representative, have as its pro-V; it is further specified as selecting either the preposition about or of for the O constituent and as not requiring rule (b).

When the N-representative associated with dream is copied into the F constituent, the result is sentence (201); when the associated verb have replaces the V, the result is (202).

(201) John dreamed a dream about Mary
(202) John had a dream about Mary

With these devices, we may in fact consider extending the interpretation of cognate-object constructions in the following way. Some words may be treated as cognate-object Vs even though the rule for replacing the pro-V is obligatory. The V nightmare, e.g., might have nightmare listed as its N-representative and have as its pro-V. Thus, on applying rule (a), structure (203) becomes the intermediate structure (204); on applying rule (b), (204) is converted to (205). Analogous uses of this device
could possibly account for the connection between suggest and make a suggestion, shove someone and give someone a shove, and so on, but many serious problems remain. In particular it is not obvious how sentences like (206) and (207) can be dealt with in accordance with these proposals.

(203)
```
P
 | V
|   |
| nightmare |
| F |
```

(204)
```
P
 | V
|   |
| nightmare |
| F |
```

(205)
```
P
 | V
|   |
| have |
| F |
```

(206) she made several ridiculous suggestions
(207) I had a terrible nightmare last night

6.4 Other problems

There are many issues for which I cannot even pretend to see solutions. The apparent connection between surface cases and 'partitive' functions; the restriction of 'definiteness' in some languages to NPs in particular surface case relations
(typically, the 'direct object'); the extreme variety of surface realizations of the same meaning (from the same deep structure?) that Jespersen illustrates in connection with what he calls 'rank shifting', to name just a few.

The difficulties mentioned so far are empirical in nature, but many formal problems exist as well. One of these is whether the permitted arrays of cases under P need to be generated via phrase-structure rules, since one of the most important functions of the PS-rules has been that of defining grammatical relations—that is, that of defining phenomena which are here partly treated categorially rather than configurationally. Related to this problem is the apparent dependency relations that exist among cases. It appears, for example, that the occurrence of B (Benefactive) phrases in a sentence has more to do with whether the sentence contains an A than with independent specific properties of Vs. One is almost willing to allow these facts to be expressed by a generative process which chooses a verb, then chooses the cases required by that verb, then chooses the other cases compatible with the cases originally chosen. The issue is not whether the permitted sequences can or cannot be generated by PS-rules—there is no doubt that they can—but whether the kinds of co-occurrence or dependency relationships that seem to obtain might not be more efficiently stated in some other way.
(Modifications of transformational grammar of the type introduced in Chomsky's ASPECTS (see fn. 1) made it no longer necessary to use PS-rules for subclassification of lexical categories or for the choice of lexical items. If the provision of syntactic relations of certain kinds must also be handled by some device other than PS-rules, there is a chance that rules of this type may be abandoned altogether.)

Whether the cases should be represented as categories dominating NPs or in some other way is an issue which seems to me to be fairly wide open. One advantage of the categorial treatment is that NPs made subject and object may be said to have lost their 'original' case relation to the sentence (by the rule which 'erases' the case category whenever the case marker K has been deleted, i.e., a 'node-razing' rule) with the result that their form can only be determined by referring to their 'pure relational' status. Thus it would appear that the surface distinction between labeled and configurationally defined relations on NPs may correspond with the traditional distinction between the 'concrete' and the 'grammatical' cases. (How the genitive figures in this distinction is not clear under either interpretation.)

Several people have pointed out to me the apparent convertibility of case grammar underlying representations into objects which resemble dependency diagrams and tagmemic formulas. If the K elements are interpreted as constituents of NPs, then the case categories unarily dominate NPs. This makes them equivalent
labels on the branches that like P with the various NPs
that are directly related to it. If the only function of the
P is to provide a constituent in terms of which the NPs can
be related to the V, one may just as well represent these
relationships more directly by replacing the node P by the V.
The result is no longer a constituent-structure diagram, since
lexical elements are inserted into 'dominating' nodes; but it
may turn out to be just as possible to represent the needed
constituent organization of sentences from a 'stemmatic' diagram
of the type used by Tesnière or Hays, as from a phrase-structure
tree diagram.

There is an easy conversion from case grammar underlying
representations to 'tagmemic' formulas, too, as long as the case
categories unarily dominate NPs. Or, for that matter, a case-
grammar diagram could simply be read off as a tagmemic formula,
as long as certain symbols were designated as function indica-
tors. One can as easily say "NP filling an A slot" as anything
else. The crucial difference between the modification of
transformational grammar that I have been suggesting and the
typical tagmemic study is in the insistence here on discovering
the 'deepest' level of the 'deep structure'.
7. Closing words

One criticism of case grammar that has been brought to my attention is that it is too strongly motivated by semantic considerations. Many of the analyses have (hopefully) the result that certain semantic distinctions and inter-language commonalities are revealed in fairly direct ways in case grammar deep structures, but, it has been argued, syntactic analyses should be based on syntactic data alone, and one language at a time.

The question arises whether there is a 'level' of syntactic description that is discoverable one language at a time based on purely syntactic criteria. If it is possible to discover a semantically justified universal syntactic theory along the lines I have been suggesting; if it is possible by rules (beginning, perhaps, with those which assign sequential order to the underlying order-free representations) to make these 'semantic deep structures' into the surface forms of sentences; then it is likely that the syntactic deep structure of the type that has been made familiar from the work of Chomsky and his students, is going to go the way of the phoneme. It is an artificial intermediate level between the empirically discoverable 'semantic deep structure' and the observationally accessible surface structure, a level the properties of which have more to do with the methodological
commitments of grammarians than with the nature of human languages.\footnote{123}

\footnote{123} I wrongly expected these remarks to have a certain shock value at the symposium. There I was attacked for constructing deep structure representations that were too hampered by considerations of surface syntactic facts to get at the underlying semantic realities. This is a problem which, as they say, requires further study.
